

TC/42/9

ORIGINAL: English

DATE: February 27, 2006

INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS

GENEVA

TECHNICAL COMMITTEE

**Forty-Second Session
Geneva, April 3 to 5, 2006**

PUBLICATION OF VARIETY DESCRIPTIONS

Document prepared by the Office of the Union

1. At its forty-first session, held in Geneva from April 4 to 6, 2005, the Technical Committee (TC) considered document TC/41/9, which provided a report on the progress in the model studies, as reported to the Technical Working Parties (TWPs) at their sessions in 2004. That report provided summaries of the data from all the model studies as reported to the TWPs in 2004 and also reported the comments made by the TWPs.
2. The purpose of this document is to report on developments in the *Ad hoc* Working Group on the Publication of Variety Descriptions (WG-PVD) and the TWPs in 2005. This document also sets out recommendations of the WG-PVD for consideration by the TC.

Ad hoc Working Group on the Publication of Variety Descriptions (WG-PVD)

3. The WG-PVD held a meeting in Geneva on April 6, 2005. In addition to the members of the WG-PVD, the meeting was attended by Mr. Chris Barnaby (Chairman of the Technical Working Party for Ornamental Plants and Forest Trees), Mr. Erik Schulte (Chairman of the Technical Working Party for Fruit Crops), Mr. Baruch Bar-Tel (Coordinator for the Model Study on Strawberry), Mr. Henk Bonthuis (joint Coordinator for the Model Study on Potato) and Mr. Kees van Ettehoven (Chairman of the Technical Working Party for Vegetables and Coordinator for the Model Study on Lettuce).

Model Study

4. The WG-PVD based its discussions on document TC/41/9 and oral reports from Mr. Baruch Bar-Tel (Coordinator for the Model Study on Strawberry), Mr. Henk Bonthuis (joint Coordinator for the Model Study on Potato), Mr. Gerhard Deneken (Coordinator for the Model Study on Barley) and Mr. Kees van Ettehoven (Coordinator for the Model Study on Lettuce).

5. Mr. Uwe Meyer (Chairman of the Technical Working Party on Automation and Computer Programs (TWC)) provided a report on the statistical guidance which the TWC had developed to assist coordinators of the model studies in the analysis and reporting of the results.

6. The participants exchanged thoughts on the initial results of the model studies and how far these provided indications in relation to one of the aims of the project i.e. whether it might be possible “to use appropriate elements of the variety description, in the process of examining distinctness, to eliminate varieties which do not require further comparison and to identify those varieties against which a further comparison is required”.

7. The initial results of the model studies indicated that the level of variation in variety descriptions obtained from different sources could be related, for example, to the type of variety and species, the type of characteristic, the geographical region where the variety was described and the way in which the characteristics were observed. It was noted that some measures might be possible to develop variety descriptions which had less variation e.g. selecting characteristics which had a low level of variation, using descriptions from within a region and improving the clarity of characteristics in the UPOV Test Guidelines. Thereafter, multivariate analysis, such as that provided by the GAIA software, might have potential as a useful tool to handle descriptions from different sources.

8. Nevertheless, it was noted that, whilst minimizing variation between variety descriptions obtained from different sources was desirable, it would be impossible to eliminate variation completely. It was also recognized that there would need to be confidence that the benefits of any measures to reduce variation would outweigh the costs involved.

9. It was recalled that an important form of harmonization within UPOV was the designation of asterisked characteristics in the Test Guidelines, which, in general, should always be examined for DUS and included in the variety description by all members of the Union. It was noted that such harmonization was particularly relevant for the exchange and purchase of DUS reports, irrespective of variations in variety descriptions.

10. On the basis of the discussions, the WG-PVD recommended that:

(a) the model studies should be completed;

(b) the TWPs and the TC should:

(i) review the results of the model studies and seek to draw conclusions on the sources and types of variation (e.g. regional variation, method of examination of characteristics);

(ii) draw conclusions in relation to the aim of the project concerning the possibility “to use appropriate elements of the variety description, in the process of examining distinctness, to eliminate varieties which do not require further comparison and to identify those varieties against which a further comparison is required”;

(iii) draw conclusions in relation to possible improvements in other relevant aspects of UPOV’s work e.g. in relation to the development of Test Guidelines;

(c) the WG-PVD should consider the conclusions of the TWPs and the TC at its next meeting.

Administrative, Legal and Financial Considerations

11. It is recalled that, at its meeting held in Geneva, on March 31, 2004, the WG-PVD agreed that, at that stage, there were no administrative, legal or financial barriers to the model studies and no urgent matters concerning administrative, legal and financial issues that needed to be addressed.

Date of Next Meeting

12. The next meeting of the WG-PVD will take place on Wednesday, April 5, 2006. As previously agreed by the WG-PVD, an invitation has been extended to the Coordinators of the Model Studies and the Chairpersons of the TWPs where their participation is possible in conjunction with attendance at the session of the TC. A list of the members of the WG-PVD, the Coordinators of the Model Studies and the Chairpersons of the TWPs is attached as Annex I.

Technical Working Parties (TWPs)

Technical Working Party for Vegetables (TWV)

13. At its thirty-ninth session, held in Nitra, Slovakia, from June 6 to 10, 2005, the TWV considered document TWV/39/6, which set out the recommendations of the WG-PVD (see paragraph 10, above), and document TWV/39/7, introduced by Mr. Mitsuo Yuasa (Japan), Coordinator for the Model Study on Chinese Cabbage. The information in document TWV/39/7, presenting the analysis of the data received for the model study on Chinese Cabbage, is reproduced as Annex II to this document.

14. The representative of the International Seed Federation (ISF) expressed some concern at the results of the model studies and the variation in variety descriptions in relation to a paper-based system where a decision on distinctness could be based on descriptions. The expert from Israel observed that the intention of the project was to consider adding variety description information in the UPOV-ROM Plant Variety Database as a means of aiding DUS examiners to identify relevant varieties. In that respect, he suggested that the information on grouping characteristics might represent a practical first step. He noted that the intention was not to replace growing trials and also observed that each provider would be responsible for the data provided and each user would be responsible for the use made of the data.

15. The expert from Spain noted that it was not known if the same sample was used for the descriptions and observed that the results of the model studies demonstrated the importance of retaining an official sample for identifying a variety. With regard to lettuce, he noted that there were only two qualitative grouping characteristics (“Seed: color” and “Leaf: anthocyanin coloration”) which could reliably be used on an international basis. The expert from France noted the potential value of disease resistance characteristics for reliable grouping of varieties.

16. Experts from Poland and Romania supported the project and considered the availability of variety descriptions information would be very helpful.

17. The Chairman, Mr. Kees van Ettehoven (Netherlands), noted the interest in having variety description information available in a database. He observed that including only information on grouping characteristics would mean that data from those characteristics would have to be extracted from other data, a process which would require additional effort. Furthermore, he wondered if the grouping characteristic information would prove sufficiently discriminatory to be of practical assistance. An alternative approach would be to accept that descriptions of varieties would vary and to publish the data on the restricted area of the UPOV website with a suitable warning. Users would then be able to decide which, if any, data to use, e.g. according to source of the data and type of characteristic, and how to use the data. He emphasized that the aim of the project was not to allow a decision on distinctness on the basis of descriptions in the database.

18. With regard to the results of the study on Chinese Cabbage, an expert from the Netherlands noted that it would be difficult to harmonize descriptions for quantitative and pseudo-qualitative characteristics. The expert from Israel noted that care was needed in selecting grouping and technical questionnaire characteristics. The TWV also heard that the results in some model studies indicated that some users of the UPOV Test Guidelines did not understand that, when the notes 3, 5, 7 were used for quantitative characteristics, it was possible to use all notes from 1 to 9.

19. The Chairman noted that ring tests in conjunction with a trial-based meeting of experts was an important means of harmonizing variety descriptions and also of identifying and rectifying weaknesses in Test Guidelines. He accepted that such ring tests would take around two years to complete in a UPOV context and would also involve costs, in particular in relation to traveling to view the trials. He wondered if this might be mitigated in some cases by arranging ring tests in advance of revisions of Test Guidelines and by the hosts of the TWV arranging trials of the species concerned. Alternatively, funds could be sought to support such work. The experts from the Czech Republic and Hungary endorsed the usefulness of ring-tests and referred to the ring test on pepper, being organized by Hungary. The expert from France reported that a ring test on carrot had proved very useful. The expert

from Mexico noted that he would be able to prepare a trial in relation to the revision of the Test Guidelines for Husk Tomato.

20. In conclusion, the TWV supported the availability of variety descriptions, whilst noting the limitations of publishing full variety descriptions, which meant that it would be difficult to publish variety descriptions at the UPOV level for the foreseeable future. It agreed that, if a project went ahead, it would be practical to concentrate any initiatives on grouping characteristics in the first instance. The TWV expressed its strong support for ring tests in conjunction with a trial-based meeting as a means for developing a clear interpretation of Test Guidelines and for preparing for revisions to Test Guidelines. It also agreed that the Test Guidelines should explain the use of the 3, 5, 7 notes in the 1-9 scale for quantitative characteristics and proposed that TGP/7 be revised accordingly.

Technical Working Party on Automation and Computer Programs (TWC)

21. At its twenty-third session held from June 13 to 16, 2005, in Ottawa, Canada, the TWC considered document TWC/23/6, which set out the recommendations of the WG-PVD (see paragraph 10, above), and document TWC/23/17 “Description of varieties in different UPOV countries”, prepared by experts from France with data provided on barley via Mr. Joël Guiard (France) and Mr. Gerhard Deneken (Denmark), and introduced by Mr. Sylvain Grégoire (France). Document TWC/23/17 is reproduced as Annex III to this document.

22. The TWC also received a brief report on discussions and conclusions of the thirty-ninth session of the TWV.

23. An expert from France briefly reported on the joint project between France, Germany and Spain on the databasing of maize inbred lines. That project had demonstrated that the scales used in different countries could shift according to the range of varieties in their variety collections. The project, which was accompanied by joint trial visits by DUS examiners from the participating countries, had been very useful in identifying variations in the interpretation of characteristics. It had also been possible to use the results to identify characteristics with more consistent descriptions for a given variety across the countries involved. The results identified some such characteristics which had been expected to produce consistent descriptions. However, some characteristics which were expected to behave in a consistent way were not as consistent as expected and some others, which were not expected to behave in a consistent way, had produced relatively consistent results. The expert noted that there was a need to adopt a step-by-step approach to achieve closer correspondence in variety descriptions and the approach needed to be done on a characteristic-by-characteristic and country-by-country basis.

Technical Working Party for Fruit Crops (TWF)

24. At its thirty-sixth session, held in Kôfu, Japan, from September 5 to 9, 2005, the TWF considered document TWF/36/6, which set out the recommendations of the WG-PVD (see paragraph 10, above), and received an oral report from Mr. Baruch Bar-Tel (Israel) on the work on the Model Study for Strawberry. It was agreed that the results of the Model Study for Strawberry should be presented at the thirty-seventh session of the TWF and, at that time, the issues raised in document TWF/36/8 could be considered further.

Technical Working Party for Ornamental Plants and Forest Trees (TWO)

25. At its thirty-eighth session, held in Seoul, Republic of Korea, from September 12 to 16, 2005, the TWO considered document TWO/38/6, which set out the recommendations of the WG-PVD (see paragraph 10, above), and TWO/38/11 “Model Study on Alstroemeria”, introduced by Mr. Joost Barendrecht (Netherlands). The information provided in document TWO/38/11 is reproduced as Annex IV to this document.

26. With regard to the recommendations of the WG-PVD, the TWO noted that the Model Study on Alstroemeria demonstrated that there were areas where the previous version of the Test Guidelines had needed to be improved in order to improve the observation of characteristics. In particular, it was noted that good illustrations were very important. It was noted that the abbreviation of the 1-9 quantitative characteristic scale to 3, 5, 7 had caused confusion with regard to the states which could be used. It was noted that the growing conditions had affected the expression of some characteristics, notably color and that caution was needed when comparing colors when observed in different locations. However, it was noted that color characteristics could still provide useful grouping information as there was generally a good agreement on the color group to which varieties belonged across locations.

Technical Working Party for Agricultural Crops (TWA)

27. At its thirty-fourth session, held in Christchurch, New Zealand, from October 31 to November 4, 2005, the TWA considered document TWA/34/6, which set out the recommendations of the WG-PVD (see paragraph 10, above) and document TWA/34/13 “Harmonization of descriptions of varieties of barley”. The information provided in document TWA/34/13 is reproduced as Annex V of this document. The TWA also received presentations from Mr. Gerhard Deneken (Denmark), Coordinator for the Model Study for Barley, and Mr. Henk Bonthuis (Netherlands), Joint Coordinator for the Model Study for Potato. Copies of those presentations are presented as Annex VI and Annex VII, respectively, to this document.

28. The TWA noted that caution was needed in the interpretation of the scatter diagrams included in the presentations by Mr. Deneken and Mr. Bonthuis. In particular, it was recalled that the points in the scatter diagrams became less meaningful where there were only small numbers of variety comparisons and the effects could be due to chance.

29. The TWA concluded that the model studies indicated that published variety descriptions might be used in a limited way for selecting varieties for inclusion in the growing trial but, in order to use such an approach, it was important for the user of the descriptions to have a detailed knowledge of the level of harmonization of variety descriptions in relation to the descriptions to be used and to understand the basis for variation in variety descriptions. If that condition was not fulfilled, there was a risk of making a wrong assessment of distinctness. With regard to possible improvements in other relevant aspects of UPOV’s work, it was agreed that the use of ring tests and the use of example varieties was important with regard to the calibration of descriptions and that quality control measures were valuable in improving harmonization. It was considered that, at the UPOV level, the development of tools, such as CD-ROMs containing photographs, could enhance the understanding of the characteristics used in the Test Guidelines and thereby reduce observer error.

Recommendations of the WG-PVD for Consideration by the TC

30. As explained in paragraph 10 (b), the WG-PVD has suggested that the TWPs and the TC :

(i) review the results of the model studies and seek to draw conclusions on the sources and types of variation (e.g. regional variation, method of examination of characteristics);

(ii) draw conclusions in relation to the aim of the project concerning the possibility “to use appropriate elements of the variety description, in the process of examining distinctness, to eliminate varieties which do not require further comparison and to identify those varieties against which a further comparison is required”; and

(iii) draw conclusions in relation to possible improvements in other relevant aspects of UPOV’s work e.g. in relation to the development of Test Guidelines.

31. With regard to point (iii) above, the TC may wish to note that the following points, raised in discussions in the TWPs, have been included as aspects which might be considered as a part of a revision of document TGP/7/1 “Development of Test Guidelines” (see agenda item 6 of document TC/42/1 and document TC/42/5, paragraph 23):

(a) the Test Guidelines should explain the use of the 3, 5, 7 abbreviated notes in the 1-9 scale for quantitative characteristics (see document TC/42/5 Annex I: Annex 1: TG Template 6.3); and

(b) to consider the development of tools such as CD-ROMs containing photographs to enhance the understanding of the characteristics used in the Test Guidelines and thereby reduce observer error (see document TC/42/5 Annex I: Annex 4: Collection of Approved Characteristics”).

32. *The TC is invited:*

(a) to review the results of the model studies and draw conclusions in accordance with paragraph 30, and

(b) to note the aspects, set out in paragraph 31, which might be considered as part of a revision of TGP/7/1 “Development of Test Guidelines”.

[Annexes follow]

ANNEX I

LIST OF WG-PVD, MODEL STUDY COORDINATORS AND TWP CHAIRPERSONS
(I.E. THOSE INVITED TO WG-PVD MEETING
TO BE HELD IN GENEVA ON APRIL 5, 2006)

Members of the WG-PVD

Ms. Julia Borys (TC Chairperson)
Ms. Nicole Bustin (France)
Mr. Gerhard Deneken (Denmark)
Mr. Krieno Fikkert (CAJ Chairman)
Mr. Joël Guiard (France)
Mr. Bart Kiewiet / Mr. José Elena (European Community)
Mr. Uwe Meyer (Germany)
Mr. Doug Waterhouse (Australia)
Ms. Sally Watson (TWC Chairman)

WG-PVD Model Study Coordinators

Mr. Joost Barendrecht (Netherlands) – (TWO) (Alstroemeria)
Mr. Baruch Bar-Tel (Israel) – (TWF) - (Strawberry)
Mr. Henk Bonthuis (Netherlands) – (TWA) - (Potato)
Mr. Gerhard Deneken (Denmark) – (TWA) - (Barley)
Mr. Kees van Ettekoven (Netherlands) – (TWV) - (Lettuce)
Ms. Alison Lean (United Kingdom) - (TWF) - (Apple)
Mrs. Andrea Menne (Germany) – (TWO) - (Petunia)
Mr. Dirk Theobald (European Community) – (TWA) - (Potato)
Mr. Mitsuo Yuasa (Japan) – (TWV) - (Chinese Cabbage)

Chairpersons of the Technical Working Parties

Mr. Alejandro Barrientos Priego (Mexico) – Chairman of the TWF
Mr. Henk Bonthuis (Netherlands) – Chairman of the BMT
Ms. Sandy Marshall (Canada) – Chairperson of the TWO
Mr. Niall Green (United Kingdom) – Chairman of the TWV
Mrs. Beate Rücker (Germany) – Chairperson of the TWA
Mrs. Sally Watson (United Kingdom) – Chairperson of the TWC

[Annex II follows]

ANNEX II

PROJECT TO CONSIDER THE PUBLICATION OF VARIETY DESCRIPTIONS
(REPORT OF THE COORDINATOR FOR CHINESE CABBAGE)

1. This Annex presents the analysis of the data received for the Model Study on Chinese Cabbage.

2. The analysis can be summarized as follows:

Pseudo-Qualitative Characteristics

Averages of “Number of frequency” range between 1.23 and 1.64.

Quantitative Characteristics

Averages of “Number of frequency” range between 1.37 and 2.00.

Average of “Number of frequency” of “Head: width” is the smallest, 1.37, and “Time of bolting” is the largest, 2.00.

Averages of “Range” range between 0.37 and 2.50. Average of “Range” of “Head: width” is the smallest, 0.37, and “Time of bolting” is the largest, 2.50.

Averages of “Standard Deviation” range between 0.26 and 1.77. Average of “Standard Deviation” of “Head: width” is the smallest, 0.26, and “Time of bolting” is the largest, 1.77.

[Annex III follows]

DESCRIPTION OF VARIETIES IN DIFFERENT UPOV COUNTRIES

Slide 1

**Description of varieties in
different UPOV countries**

Prepared by experts
from France with data
provided on barley via
J Guiard and
G Deneken

Slide 2

- A set of varieties has been described by 13 countries in the year 2003
- Notes have been summarised in one Word file per variety

Example where no comparison is possible

The screenshot shows the 'Gais' software interface for visualizing comparisons between varieties. The main window displays a table of comparison results for 116 characteristics across different varieties. The table is titled 'Résultats de la comparaison qualitative entre les 2 variétés courantes [26]'. The columns include 'N° Caract.', 'Libellé long', 'Poids', and four 'Note' columns for different cycles. Many cells in the 'Note' columns are shaded grey, indicating that no comparison was possible for those characteristics and varieties.

N° Caract.	Libellé long	Poids	Note Etd./Cycle 1	Note Ref./Cycle 1	Note Etd./Cycle 2	Note Ref./Cycle 2
88	Plant grow habit	0.00		0	0	0

Note Etd. / Cycle = Note de la variété étudiée dans le cycle 1 ou 2
Note Ref. / Cycle = Note de la variété étudiée dans le cycle 1 ou 2
Nb : Les caractères avec des notes identiques pour les deux variétés dans les 2 cycles ne sont pas affichés !

Slide 16

Variability is different on different varieties, and also differs from character to character

Slide 20

- We are very far from equivalent descriptions in different countries, even when a difference of 2 notes is used
- With a specific exercise, the data set was expected to be good, the study suggests some improvements can be achieved

[Annex IV follows]

ANNEX IV

PROJECT TO CONSIDER THE PUBLICATION OF VARIETY DESCRIPTIONS:
MODEL STUDY ON ALSTROEMERIA

Document prepared by experts from the Netherlands

1. In the model study on Alstroemeria descriptions were requested for 7 varieties which had been plant breeders' rights in Canada, Japan, the Netherlands and South Africa.
2. Descriptions of the following varieties were received:

Stabec:	a pink flowered variety used for cut flower production
Stamond:	a white flowered variety used for cut flower production
Staprilan:	a yellow flowered variety used for production of pot plants
Staprinag:	a white flowered variety used for production of pot plants
Staprisis:	a white flowered variety used for production of pot plants
Stasach:	a red flowered variety for production of cut flowers
Statiren:	a pink flowered variety for production of cut flowers
3. The following photographs and additional documentation on the growing of the plants (as far as available) were received from 3 countries:

Canada

- Color photographs were taken by the testing centre
- The plants were grown in summer/Fall in pots or open greenhouse; all in 5 gallon pots; duration of growth 4 to 6 months
- Minimum temperature 12 C; full sunlight
- Pot varieties are grown in the same way as varieties for cut flower production, the only difference being a smaller pot for the pot types (10 inch pot)

Japan

- No pictures were made at the testing centre
- In Japan there is normally on-site inspection
- The applicants are given the following information: Planting in the greenhouse, number of plants and spacing
- Planting time: Spring: May; or Autumn: September

Netherlands

- Photographs from the testing centre
- Growing in autumn/winter/spring in the greenhouse
- Temperature low, to be kept free from frost in winter
- No shading
- Flowering in April/May

- Pot varieties are treated in the same way as varieties grown for cut flower production: both are grown in the open greenhouse soil.

Results

4. The survey of the data received from the different countries is provided as Appendix I. Appendix 2 provides selected characteristics, which include those characteristics which will be retained in the new draft Test Guidelines and the non-asterisked characteristics in that draft. The UPOV Color Groups have been added where applicable.

Discussion

Char. 1 Stem: length

RSA scores 3 for the pot varieties. That is interesting as these varieties are expected at the bottom of the scale. No further information has been received from RSA. For the cut-flower varieties Japan scored lower than the Netherlands, perhaps due to different growing circumstances.

Char. 8 Umbel branches: number

Rather consistent scores.

Char. 9 Umbel branches: length

Some variation; length is strongly depending on the time of observation.

Char. 10 Pedicel: length

Same comment as for Char. 9.

Char. 11 Flower: main color

Stabec: note 6, red, appears to deviate compared to notes 7 and 8 light pink and pink. Perhaps the red blotch on a pink background is impressive and, whilst not covering the largest part of the flower, has been the basis of the decision here.

Staprinag: the same as for Stabec, but in this case, there is a light pink blotch on a white background.

For the other varieties there may often be confusion by taking the most impressive color instead of the color that is covering the largest part of the surface. In addition, there is difficulty in the cases where 2 colors cover the surface on a 50/50 basis.

Char. 12 Size

Rather consistent scores.

Char. 14 Outer tepal: Shape of blade

Hopefully attention will be paid in the shape document to the distinctness between the shapes mentioned here. The same remark on the distinctness between claw and blade.

Char. 16 Main color of inner side of blade

The confusion that can be seen here has already been solved in the revised draft by dividing the petal into several parts for color observation.

Char. 18 Outer tepal: number of stripes on inner side of blade

The same as for Char. 16: division in parts and better definition.

Char. 20 Inner lateral tepal: main color of inner side of middle zone of blade

Not so much variation as far as the color groups are concerned. Yellow orange for Stasach is questionable.

Char. 22 Inner lateral tepal: size of stripes on inner side of blade.

Rather large variation in states, which has been addressed in the new draft Test Guidelines by division into parts and better definition of the characteristic.

Char. 23 Stamen: main color of filament

Some understandable variation in states

Char. 25 Stamens: color of the anthers at the start of dehiscence

This characteristic is very dependent on the time of observation. The color of the pollen is *not* meant here.

Char. 26 Anthocyanin coloration of the ovary.

Extremely variable results, which has been addressed in the draft Test Guidelines by a more precise definition.

General

It appears that the differences may be partly caused by different environmental factors between the different testing locations but also by unclear definitions of characteristics and/or the indication of the time of observation.

ANNEX V

PROJECT TO CONSIDER THE PUBLICATION OF VARIETY DESCRIPTIONS:
BARLEY*Document prepared by experts from Denmark*

HARMONIZATION OF DESCRIPTIONS OF VARIETIES OF BARLEY

1. 1,191 descriptions from 16 UPOV members (Argentina (AR), Austria (AT), Canada (CA), Czech Republic (CZ), Denmark (DK), Estonia (EE), France (FR), Germany (DE), Hungary (HU), Lithuania (LT), New Zealand (NZ), Russia (RU), Slovakia (SK), Slovenia (SI), Spain (ES), South Africa (ZA), United Kingdom (GB)) and had been received by December 2004. The 1,191 descriptions originated from 756 varieties. The descriptions had been elaborated over a period of 31 years, but the largest number of descriptions was created during the last 10 years.

2. Three different versions of the UPOV Test Guidelines (TG/19/5, TG/19/7 and TG/19/10) were the basis of the elaborated descriptions. Two varieties were described according to TG/19/5 and those descriptions were excluded from the investigation. To have as many valid comparisons as possible, characteristics from TG/19/7 were converted to the equivalent numbering of TG/19/10 and all comparisons are based on TG/19/10.

3. To evaluate the level of harmonization between descriptions of the same variety, varieties with 3 or more descriptions (100 varieties) were selected, resulting in 2,871 variety* character combinations. An example of these comparisons is given in Table 1, where every line represents the combination of one variety and one characteristic. The column “number of received descriptions” indicates the number of received descriptions of the characteristic and variety in question. For example, the variety ‘Tolar’ has 2 descriptions of characteristic 1. One description gave note 5 and the other description gave note 6 as the state of expression. This means 2 different notes were used. “Range” indicates the difference between the 2 different notes used. Finally the standard deviation between the 2 notes is calculated and displayed.

Table 1: Example of examination of harmonization of descriptions between members (2 characters of 2 different varieties) – all comparisons are given in the Appendix

Char.-no	Char.-type	Characteristic	Variety Denomination	No of received descriptions	State of expression									freq. notes	range	std		
					1	2	3	4	5	6	7	8	9					
1	*	PQ	Plant: growth habit	TOLAR	2					1	1					2	2	0,71
			Flag leaf: intensity of anthocyanin coloration of auricles	ANNABELL	9							1	3	1	4	4	4	1,17

Further 2,869 records – see Appendix

4. The examination is based on individual characteristics and the information of every characteristic is summarized across all varieties in Table 2, where the characteristics are sorted according to the average standard deviation of every characteristic.

5. Characteristic 2 ‘Lowest leaves: hairiness of leaf sheaths’ and characteristic 13 ‘Ear: number of rows’ are described in the same way between the contributing members of UPOV across the examined number of varieties (331 and 408 recordings). In characteristic 27, ‘Grain: disposition of lodicules’, there is a variation between the recordings of this characteristic for 2 varieties. The variety Calgary has been described with note 1 by one member and 2 other members describe Calgary with note 2. The variety Volga has been described with note 1 by one member and note 2 by another member. Two out of 328 recordings cause this deviation. Similar minor deviations occur in characteristics 22, 29 and 26. Characteristic 22 ‘Grain: rachilla hair type’ has 3 varieties (Maud, Regina and Tiffany) with different recordings - 3 out of 396. Characteristic 29 ‘Seasonal type’ both Astrid, Landi and Steffi have different recordings - 3 deviating recordings out of 391. Characteristic 26 ‘Grain: hairiness of ventral furrow’ has 2 varieties (Chariot and Nelly) with different recordings.

6. Characteristic 23 ‘Grain: husk’ shows a slightly higher degree of variation, but this is caused by only 3 varieties (Maud, Prima and Catania) having descriptions with the notes 1 and 9.

7. Characteristic 3 ‘Flag leaf: anthocyanin coloration of auricles’, characteristic 8 ‘Awns: anthocyanin coloration of tips’ are both characteristics with 1 or 9 as the state of expression. The examination shows that in most cases it is straightforward to classify the varieties, but there are cases where the variation between members is difficult to eliminate. For example, in characteristic 3, 5 varieties have been recorded with both states 1 and 9. In characteristic 8, 7 varieties have been recorded with both states 1 and 9.

8. Characteristic 21 ‘Median spikelet: length of glume and its awn relative to grain’, characteristic 28 ‘Kernel: color of aleurone layer’ and characteristic 20 ‘Sterile spikelet: attitude (in mid-third of ear)’ are all pseudo-qualitative characteristics scored on a 1-3 scale. In many cases there is a consistent recording. But these characteristics show the difficulty of harmonized scoring. For example, characteristic 20 has 58 varieties with variable recordings, but there is no variety covering all three states of the scale. 16 of the 55 varieties have one main type of recording and a deviating note.

Figure 1: Average standard deviation between descriptions of characteristic 25 ‘Grain: spiculation of inner lateral nerves of dorsal side of lemma’

Characteristic 21 has 21 varieties with variable states of expression, but no variety covering all 3 states. Characteristic 28 has 37 varieties with variation in the states of expression, and 2 varieties (Hanna and Petra) have states covering all 3 states of expression.

Characteristic 25 ‘Grain: spiculation of inner lateral nerves of dorsal side of lemma’ has a reasonably harmonized expression especially if the variety is scored as absent or very weak or strong to very strong. If the notes given are higher than 2 and lower than 8 a higher degree

of variation between the descriptions occurs than at the ends of the scale (see figure 1).

Table 2: Characteristic examination on the level of harmonization

char_no	CHAR_TYPE1	CHAR_type2	CHAR_TXT	no_var	no of recordings	avg_freq_notes	avg_range	avg_std	classification

11		PQ	Ear: attitude	100	402	2,79	4	1,4	NH

9. Characteristic 7 ‘Time of ear emergence (first spikelet visible on 50% of ears)’ has a very variable distribution across the different UPOV members. Only 15 varieties have harmonized recording in all members. The other varieties vary between 2 and 5 states of expression. For example, Meltan covers a wide range from ‘very early to early’ up to ‘medium to late’. Characteristic 1 ‘Plant: growth habit’, characteristic 6 ‘Flag leaf: glaucosity of sheath’, characteristic 14 ‘Ear: shape’, characteristic 15 ‘Ear: density’, characteristic 16 ‘Ear: length (excluding awns)’ and characteristic 18 ‘Rachis: length of first segment’ have a similarly variable distribution of recordings.

10. All remaining characteristics have a higher degree of variation and their recording can be classified as non-harmonized as the state of expression covers a wide range of the scale.

11. All 6 grouping characteristics work well in terms of a harmonized recording. Deviations are probably caused by mistakes or environmental variations. For example,

“Seasonal type” can show different scoring dependent on the climatic conditions. A simple validation/quality assurance process could eliminate these deviations.

12. The Test Guidelines for Barley, document TG/19/10, have 18 asterisked characteristics. 10 of these characteristics can be regarded as harmonized in terms of recording the state of expression of the different varieties. Of these 10 asterisked characteristics, characteristic 3 ‘Flag leaf: anthocyanin coloration of auricles’ and characteristic 8 ‘Awns: anthocyanin coloration of tips’ are classified as qualitative characteristics. Under certain environmental conditions it can be very difficult to state the variety as clearly without anthocyanin. The characteristics should be combined with characteristic 4 ‘Flag leaf: intensity of anthocyanin coloration of auricles’ and characteristic 9 ‘Awns: intensity of anthocyanin coloration of tips’ to form quantitative characteristics for the intensity of anthocyanin coloration of auricles and tips.

13. Five asterisked characteristics are classified as non-harmonized.

- Characteristic 12: Plant: length (stem, ear and awns)
- Characteristic 4: Flag leaf: intensity of anthocyanin coloration of auricles
- Characteristic 10: Ear: glaucosity
- Characteristic 9: Awns: intensity of anthocyanin coloration of tips
- Characteristic 17: Awn: length (compared to ear)

14. These characteristics are susceptible to environmental variations like day length, solar irradiation or water stress. The evaluation shows this very clearly, e.g. a commonly known variety like ‘Barke’ covers a range of 7 notes for ear glaucosity and the characteristic has an average range of 3.3 notes across all varieties. Plant length also shows variation of 7 notes for one variety. For example, ‘Danuta’ has been described as ‘short’ (3) and ‘long to very long’ (9).

15. Characteristic 4 ‘Flag leaf: intensity of anthocyanin coloration of auricles’ shows an average range of 2.9 and varieties like Pewter, Thuringia and Viskosa are described with a difference of 6 notes. Characteristic 9 ‘Awns: intensity of anthocyanin coloration of tips’ shows the same degree of variation. Characteristic 17 ‘Awn: length (compared to ear)’ is the characteristic with the second highest variation. This variation, mainly caused by environmental influence, should be eliminated by the use of example varieties, but in many cases the example varieties of the UPOV Test Guidelines are no longer grown or are difficult to obtain. When revising guidelines, attention should be paid to the future maintenance of these example varieties. How will it be possible to continuously provide seed of these example varieties, to maintain a unique reference point regarding the different states of expression?

16. Another aspect which probably will enhance the harmonization of variety description is the conduct of a routine ring test. The ring test should be repeated after a certain period, and could focus on selected difficult characteristics.

Potential Use of Publication of Variety Descriptions

17. If the descriptions of barley varieties created by the testing authorities were available to other testing offices, the descriptions could be used in connection with a pre-screening tool regarding the management of the collection of varieties used in the DUS examination. The

aim is to reduce the number of varieties grown in the field and restrict the field comparisons to the most similar varieties of common knowledge.

18. With the received descriptions, it is possible to examine the discriminative power of the dataset. Only varieties with 2 or more descriptions are included in this evaluation (222 varieties). Initially a minimum distance for every characteristic is set (Table 3). The minimum distance depends on the classification of the characteristics in Table 2. Every description of a contributing country is then compared against all other descriptions and the number of distinct and non-distinct descriptions is counted. Based on these figures, it is possible to evaluate the discriminating power in % as the number of distinct descriptions/total no of descriptions *100. For pre-screening to be as effective as possible, a high discriminative power is desirable.

Table 3: Characteristics and minimum distances used for pre-screening

No	Characteristic	Scale	Type	Classification	MD level 1	MD level 2	
1	Plant: growth habit	1-9	*	PQ	AH	3	4
6	Flag leaf: glaucosity of sheath	1-9		PQ	AH	2,5	3,5
7	Time of ear emergence (first spikelet visible on 50% of ears)	1-9	*	QN	AH	2	2,5
14	Ear: shape	1-9		PQ	AH	2,5	3,5
15	Ear: density	1-9	*	PQ	AH	2,5	3,5
16	Ear: length (excluding awns)	1-9		QN	AH	3	3,5
18	Rachis: length of first segment	1-9		PQ	AH	2,5	3,5
25	Grain: spiculation of inner lateral nerves of dorsal side of lemma	1-9		PQ	AH	2,5	3,5
2	Lowest leaves: hairiness of leaf sheaths	1/9	*-g	QL	H	8	8
3	Flag leaf: anthocyanin coloration of auricles	1/9	*	QL	H	8	8
8	Awns: anthocyanin coloration of tips	1/9	*-g	QL	H	8	8
13	Ear: number of rows	1/2	*-g	QL	H	0,9	0,99
20	Sterile spikelet: attitude (in mid-third of ear)	1-3	*	PQ	H	1,1	2
21	Median spikelet: length of glume and its awn relative to grain	1-3		PQ	H	1,1	2
22	Grain: rachilla hair type	1/2	*-g	QL	H	0,9	0,99
23	Grain: husk	1/9	*	QL	H	8	8
26	Grain: hairiness of ventral furrow	1/9	*-g	QL	H	8	8
27	Grain: disposition of lodicules	1/2	*	PQ	H	0,9	0,99
28	Kernel: color of aleurone layer	1-3		PQ	H	1,1	2
29	Seasonal type	1-3	*-g	PQ	H	8	8
4	Flag leaf: intensity of anthocyanin coloration of auricles	1-9	*	PQ	NH	5	6,25
5	Plant: frequency of plants with recurved flag leaves	1-9		PQ	NH	5	6,25
9	Awns: intensity of anthocyanin coloration of tips	1-9	*	PQ	NH	5	6,25
10	Ear: glaucosity	1-9	*	PQ	NH	5	6,25
11	Ear: attitude	1-9		PQ	NH	5	6,25
12	Plant: length (stem, ear and awns)	1-9	*	QN	NH	5	6,25
17	Awn: length (compared to ear)	1-9	*	QN	NH	5	6,25
19	Rachis: curvature of first segment	1-9		PQ	NH	5	6,25
24	Grain: anthocyanin coloration of nerves of lemma	1-9		PQ	NH	5	6,25

19. To examine the quality of this distinctness evaluation the number of descriptions of the same variety (from other contributing countries) are counted, depended on their examination as distinct and non distinct (Table 4). The relative ratio of these figures (distinct/(distinct + non-distinct)*100), gives the chance of declaring a description from the same variety as distinct.

20. For example, DK – Apex is examined against all received descriptions. The number of distinct and non-distinct variety*country combinations are counted and summarized across all varieties.

21. In the distinct combinations the number of Apex descriptions from other countries are considered to be a wrong result for distinctness examination during the pre-screening process as these descriptions are expected to be identical and not distinct. The sum of mistakes is put in relation to the total number of possible Apex*country combinations.

22. In Table 4, an example of the distinctness evaluation is given. For example, all Apex*country combinations are given, based on all harmonized and acceptable harmonized characteristics. The Estonian Apex description has in characteristic ‘Grain: spiculation of inner lateral nerves of dorsal side’ the state of expression 8 where all other countries have state 1.

Table 4: Example of distinctness evaluation

no	characteristic	Apex							
		CZ	DE	DK	ES	EST	FR	SK	
1	Plant: growth habit	.	5	5	5	4	5	5	3.00
2	Lowest leaves: hairiness of leaf sheaths	.	1	.	.	1	1	1	8.00
3	Flag leaf: anthocyanin coloration of auricles	9	9	9	9	9	9	9	8.00
6	Flag leaf: glaucosity of sheath	8	.	7	7	8	7	7	2.50
7	Time of ear emergence (first spikelet visible on 50% of e	.	4	4	5	5	.	3	2.00
8	Awns: anthocyanin coloration of tips	.	9	9	9	9	9	9	8.00
13	Ear: number of rows	1	1	1	1	1	1	1	0.90
14	Ear: shape	.	.	5	1	5	5	5	2.50
15	Ear: density	.	6	4	5	5	4	.	2.50
16	Ear: length (excluding awns)	.	.	5	5	4	6	.	3.00
18	Rachis: length of first segment	.	.	5	3	4	5	.	2.50
20	Sterile spikelet: attitude (in mid-third of ear)	.	2	3	2	3	3	3	1.10
21	Median spikelet: length of glume and its awn relative to	.	.	2	2	2	2	2	1.10
22	Grain: rachilla hair type	.	2	2	2	2	2	.	0.90
23	Grain: husk	9	9	9	3	9	9	.	8.00
25	Grain: spiculation of inner lateral nerves of dorsal side	.	1	1	1	8	1	.	2.50
26	Grain: hairiness of ventral furrow	1	1	1	1	1	1	.	8.00
27	Grain: disposition of lodicules	.	.	2	2	2	2	.	0.90
28	Kernel: color of aleurone layer	1	1	1	1	1	1	.	1.10
29	Seasonal type	3	3	3	3	3	3	.	0.90

23. Due to this difference, the Estonian Apex will be considered as distinct using the minimum distance to evaluate distinctness. One out of 7 descriptions deviates, and based on Apex there is a mistake rate of 14% (1/7). The relationship between the number of possible combinations and the number of mistakes for the same variety are accumulated across all varieties and an average mistake based on a set of characteristics is given.

24. This exercise can be done on different subsets of characteristics and with the use of different minimum distances (Table 3). In Table 5 the resulting figures are given. The first record shows the discriminative power of the grouping characteristics. These characteristics would reduce the number of variety comparisons by 58%. The rate of 6% of mistakes is based on deviations as described under the individual characteristics. This rate of mistakes

could be eliminated by a simple quality assurance procedure, when comparing new descriptions with already elaborated descriptions from other countries. These grouping characteristics are used by all members and are the current level of pre-screening.

25. Using the harmonized characteristics with the minimum distance set to level 1 increases the discriminative power by 7%, but also increases the risk of making mistakes by 7%. An increase of the minimum distance to level 2 does not change these key figures.

26. Using the asterisked characteristics with the minimum distance at level 2 increases the pre-screening efficiency from 58 to 68%, but also increases the chance of declaring a variety distinct against itself from 5 to 11%.

27. Using the set of harmonized and acceptable harmonized characteristics with the minimum distance level 2 increases the discriminative power to approximately 73%, but also increases the chance of declaring a variety distinct against it self to 19%. Using all characteristics with a minimum distance of level 2 give approximately the same result.

28. Reducing the minimum distance from level 2 to level 1 increases the discriminative power, but also increases the chance of declaring a variety as distinct against itself to more than 25%.

Table 5: Discriminative power of morphological descriptions from different sources

	% distinct	% mistakes
Grouping	58	6
Harmonized - level 2 of min distance	65	13
Harmonized - level 1 of min distance	65	13
Asterisk - level 2	68	11
Harmonized and acceptable harmonized 2-level of min distance	73	19
All characteristics - level 2 of min distance	74	19
Asterisk - level 1	81	25
Harmonized and acceptable harmonized - level 1 of min distance	82	29
All characteristics - level 1 of min distance	87	34

29. This pre-screening is using the declaration of a variety as distinct against itself as a quality parameter of this process. As the descriptions of the same variety can be considered as the most similar, actually identical, the performance of other similar varieties to a candidate variety cannot be evaluated by doing desk research but needs a real time pre-screening evaluation. The chance of making mistakes is expected to be higher than in this evaluation. At the moment it seems as if an effective pre-screening based on description needs a strong control of the environment which would only allow pre-screening based on descriptions from the same source – authority, testing site and with a carefully evaluated minimum distance.

30. Another open question, which needs to be solved, is how to handle varieties where one description shows distinctness but the others do not.

Summary/Conclusions

31. Twelve characteristics from TG/19/10 are considered to be harmonized. 5 of 18 asterisked characteristics are considered to be non-harmonized. To enhance the harmonization of variety descriptions, 2 main items would need to be addressed:

- maintenance of example varieties
- routine ring tests between testing offices

32. The use of descriptions in connection with a pre-screening tool shows the potential of discriminative power depending on the selected characteristics and the estimated minimum distance. A reduction of the minimum distance increases the discriminative power, but also increases the chance of declaring a variety distinct against itself.

33. Using the grouping characteristics, which is considered to be the current level, eliminates approximately 50% of all unnecessary variety comparisons. Further elimination of variety comparisons based on variety descriptions increases the possibility of declaring a variety distinct from itself to more than 32%, if 86% of all variety comparisons are eliminated based on a pre-screening tool using earlier elaborated descriptions from other members.

34. As there are assumptions in the performed desk research a real time pre-screening evaluation would need to be performed to give the accurate figures regarding discriminative power and the risk of taking wrong decisions.

ANNEX VI

PROJECT TO CONSIDER THE PUBLICATION OF VARIETY DESCRIPTIONS:
BARLEY

At the thirty-fourth session of the Technical Working Party for Agricultural Crops held in Christchurch, New Zealand, from October 31 to November 4, 2005, Mr. Gerhard Deneken (Denmark), Coordinator for the Model Study for Barley, made the following presentation concerning the Model Study for Barley, as reported in document TWA/34/13.

[Appendix follows]

APPENDIX TO ANNEX VI

Slide 1

**Harmonisation of Descriptions of Barley Varieties
Summary/conclusions**

- 12 characteristics from TG/19/10 are considered to be harmonised.
- 5 of 18 asterix characteristics are considered to be non harmonised.
 - maintenance of example varieties
 - routinely ring tests between testing offices
- Potential of the discriminative power depends on
 - the selected characteristics and
 - the estimated minimum distance.
 - A reduction of the minimum distance increases the discriminative power, but also increases the chance of declaring a variety distinct against itself.
- Using the grouping characteristics eliminate approximately 58% of all unnecessary variety comparisons.

Slide 2

**Example of Harmonisation Evaluation
Selected characteristics of Meltan**

Slide 24

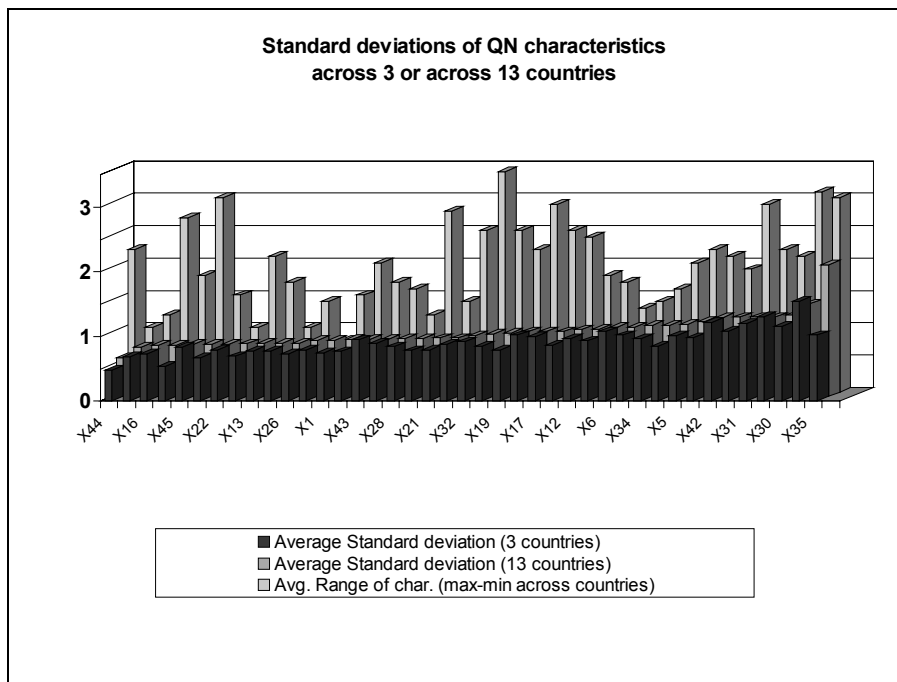

QN char. - Standard deviations and Ranges across all countries

Slide 25

Slide 26

Slide 27

Similarities among environments

■ Correspondence analysis (multivariate - biplot):

- similarities among countries for different sets of char.
- pca for differences among (groups of) countries:
 - group of 3 North West European countries (NL-DE-CZ)
 - group of 5 North West European countries (NL-DE-CZ-SL-PO)
 - All countries (NW-EU, Commonwealth and Israel).
- multidimensional projection of correlations among characteristics on corresponding axes.

Slide 28

Total dataset

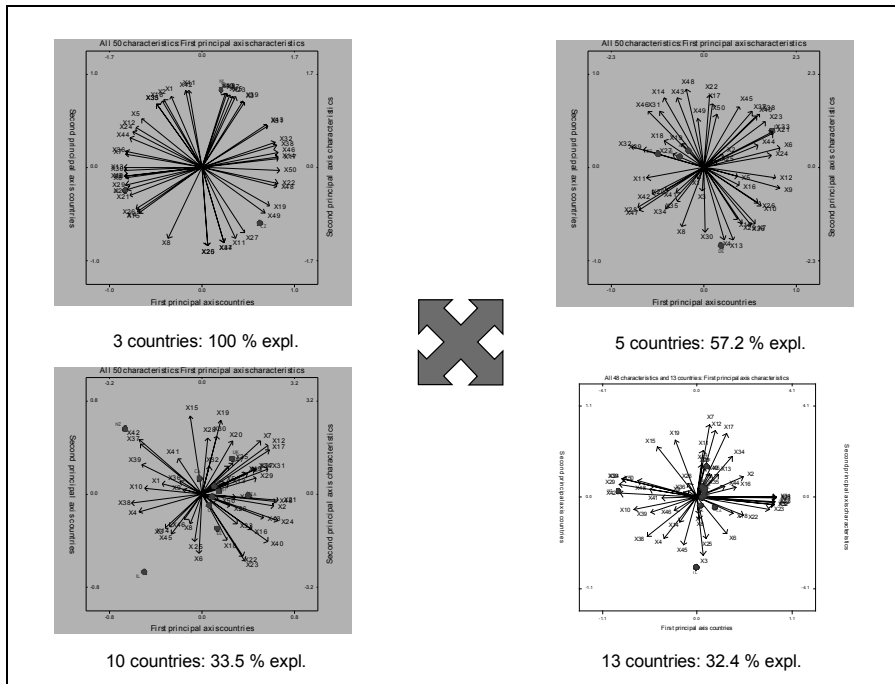

Countries cluster in the centre.

IL, NZ main outliers.

CA, ZA, UK deviating for some characteristics

Slide 36

Slide 37

Conclusions

- Characteristics
 - Some PQ and QL-characteristics are stable (skin and flower colour)
 - Most QN's are not stable across environments (in general)
 - Some QN-characteristics are more stable than others
 - Asterisked characteristics are not more stable than non-asterisked char.
- Regional similarities
 - Stability of char. across environments seems to increase in regional subsets
 - Further regional calibration is needed (especially on QN-characteristics)
 - Calibration can be achieved by use of ringtests and example varieties.
- Publication of Variety Descriptions ?
 - Descriptions should only be published when at least 3 descriptions per variety are available.
 - Mistakes and obvious deviations should be checked and (if necessary) corrected.
 - Descriptions can be based on stable (QL and PQ) characteristics.
 - Most QN-characteristics are not stable – they require special thresholds for distinctness.
