## GUIDELINES

### FOR THE CONDUCT OF TESTS

### FOR DISTINCTNESS, UNIFORMITY AND STABILITY

MEADOWFESCUE,  
(*Festucapratensis* Huds.)

TALLFESCUE  
(*Festucaarundinacea* Schreb.)

These Guidelines should be read in conjunction with document TG/1/2, which contains explanatory notes on the general principles on which the Guidelines have been established.

<u>TABLE OF CONTENTS</u>	<u>PAGE</u>

IX. Literature.....	13
X. Technical Questionnaire.....	14

## I. Subject of these Guidelines

These Test Guidelines apply to all varieties of Meadow Fescue (*Festuca pratensis* Huds.) and Tall Fescue (*Festuca arundinacea* Schreb.).

## II. Material Required

1. The competent authorities decide when, where and in what quantity and quality the plant material required for testing the variety is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must make sure that all customs formalities are complied with. The minimum quantity of seed to be supplied by the applicant:

1,5kg.

The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. In cases where the seed is to be stored, the germination capacity should be as high as possible and should be stated by the applicant.

2. The seed must not have undergone any treatment unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

## III. Conduct of Tests

1. The minimum duration of tests should normally be two independent growing cycles.

2. The tests should normally be conducted at one place. If any important characteristics of the variety cannot be seen at that place, the variety may be tested at an additional place.

3. The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination. The size of the plots should be such that plants or parts of plants may be removed for measuring and counting without prejudice to the observations which must be made up to the end of the growing period. Each test should be designed to result in a total of at least 60 spaced plants and 10 meters of row plot. Separate plots for observation and for measuring can only be used if they have been subjected to similar environmental conditions.

4. Plots with spaced plants. Each test should consist of 60 single spaced plants arranged in 3 or more replicates.

5. Row plots. Each test should consist of at least 10 meters of row arranged in two or more replicates. The density of sowings should be such that about 160 to 200 plants per meter can be expected.

6. Additional tests for special purposes may be established.

#### **IV. Methods and Observations**

1. Unless otherwise stated, all observations on spaced plants should be made on 60 plants or parts taken from each of 60 plants.
2. Observations on rows should be made one each row as a whole.
3. Where observations can be made in both spaced plant sand row plots, it is likely that the expression of the characteristic and its method of recording are different because in single spaced plants the plants can be examined as discrete units.
4. The assessment of uniformity for cross-pollinated varieties should be according to the recommendations in the General Introduction.

#### **V. Grouping of Varieties**

1. The collection of varieties to be grown should be divided into groups to facilitate the assessment of distinctness. Characteristics which are suitable for grouping purposes are those which are known from experience not to vary, or to vary only slightly, within a variety. Their various states of expression should be fairly evenly distributed throughout the collection.
2. It is recommended that the competent authorities use the following characteristics for grouping varieties:
  - (a) Ploidy (characteristic 1)
  - (b) Leaf: intensity of green colour during vegetative growth stage (characteristic 4) (for *Festuca arundinacea* only)
  - (c) Plant: time of inflorescence emergence (after vernalization) (characteristic 8)
  - (d) Stem: length of longest stem including inflorescence (when fully expanded) (characteristic 11) (for *Festuca arundinacea* only)

#### **VI. Characteristics and Symbols**

1. To assess distinctness, uniformity and stability, the characteristics and their states as given in the Table of Characteristics should be used.
2. Notes (numbers), for the purposes of electronic data processing, are given opposite the states of expression for each characteristic .

3. Legend:

(\*) Characteristics that should be used on all varieties in every growing period over which the examinations are made and always be included in the variety description except when the state of expression of a preceding characteristic or regional environmental conditions render this impossible.

(+) See Explanations on the Table of Characteristics in Chapter VIII.

1) Type of assessment:

MG: measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

To be observed on    A=spaced plants  
                      B=row plots  
                      C=special tests

F.p.=*Festuc a pratensis* Huds.

F.a.= *Festuca arundinacea* Schreb.

### VIII. Explanations on the Table of Characteristics

#### Ad.1:Ploidy

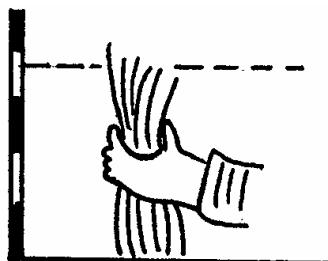

Amphiploid: Cross between hexaploid and decaploid with a variable number of chromosomes.

#### Ad.2+9: Only for F.p.: Plant:growth habit (as for 3)(2) and Plant: inflorescence emergence (9)

The growth habit should be assessed visually from the attitude of the leaves of the plant as a whole. The angle formed by the imaginary line through the region of greatest leaf density and the vertical should be used.

#### Ad.5: Only for F.p.: Plant:length(at the end of growing period before vernalization)

The mean length of the longest leaves should be measured with the plant held upright.

#### Ad.6: Plant:tendency to form inflorescences (without vernalization)

The number of plants showing at least three inflorescences should be recorded for each variety. To be assessed on one occasion on the whole trial when the varieties are judged to have reached their full expression of this characteristic.

Ad. 8:Plant:timeofinflorescenceemergence(aftervernalization)A. Plots with spaced plants

The date of inflorescence emergence of each single plant should be assessed. A single plant is considered to have headed when the tip of three inflorescence scan be seen protruding from the flag leaf sheath. From the single plant data a mean date per plot and a mean date per variety is obtained.

B. Row plots

At each observation date the average plot stage should be expressed in one of the following growth stages:

- 1) Boot swollen
- 2) Tip of inflorescence just visible
- 3) 1/4 of inflorescence emerged
- 4) 1/2 of inflorescence emerged.

The date of inflorescence emergence is the date at which the average plot stage 2 has been reached. This date should, if necessary, be obtained by interpolation.

IX. Literature

Fermanian, T.W. Haley, J.E. Wessels, K. Wilkinson, H.T. Han, S., Characterization of tall fescue and perennial ryegrass cultivars. Journal of Turfgrass Management. 1996. 1: 4, 63-79.

6. Similar varieties and differences from these varieties			
Denomination of similar variety	Characteristic in which the similar variety is different <sup>o)</sup>	State of expression of similar variety	State of expression of candidate variety
<sup>o)</sup> In the case of identical states of expressions of both varieties, please indicate the size of the difference.			

7. Additional information which may help to distinguish the variety

7.1 Resistance to pests and diseases

7.2 Special conditions for the examination of the variety

7.3 Other information

8. Authorization for release

(a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes            No     

(b) Has such authorization been obtained?

Yes            No     

If the answer to that question is yes, please attach a copy of such an authorization.
