TC/33/11
ORIGINAL: English
DATE: May 1, 1997

INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS
GENEVA

TECHNICAL COMMITTEE

**Thirty-Third Session
Geneva, October 16 to 18, 1996**

REPORT

adopted by the Technical Committee

Opening of the Session

1. The Technical Committee (hereinafter referred to as "the Committee") held its thirty-third session in Geneva from October 16 to 18, 1996. The list of participants is reproduced in Annex I to this report.
2. The session was opened by Mr. Joël Guiard (France, Chairman of the Committee), who welcomed the participants.

Adoption of the Agenda

3. The Committee adopted the Agenda as reproduced in document TC/33/1.

PROGRESS REPORTS ON THE WORK OF THE TECHNICAL WORKING PARTIES

Progress Report on the Work of the Technical Working Party for Agricultural Crops (TWA)

4. Mr. H. Ghijsen (Netherlands, Chairman of the TWA) reported that the TWA had held its twenty-fifth session in Thessaloniki, Greece, from June 11 to 14, 1996. The full report on that session appears in document TWA/25/13. During its session the TWA completed, for presentation to the Committee for adoption, draft Test Guidelines for Rape Seed (Revision).

It also completed, for presentation to the professional organizations for comments, draft Test Guidelines for Soya Bean (Revision). It also discussed, but will have to continue to discuss in its next session, draft Test Guidelines for Bromus, Cotton (Revision), Lotus, Opium Poppy, Rice (Revision), Subterranean Clover, Sunflower (Revision) and Tobacco. In addition to the discussions on Test Guidelines, the Working Party discussed or rediscussed the following subjects:

(a) It noted that applications for protection for GM varieties had been received or were expected in a few States.

(b) It noted the new procedure for the establishing of Test Guidelines and the stage of preparation of the UPOV-ROM Plant Variety Database.

(c) It discussed the possible use of electrophoresis in potato, Kentucky Bluegrass, ryegrass and timothy. It will present the problems raised during the discussions to the Committee and some legal questions also to the Administrative and Legal Committee.

(d) It will apply the method prepared by the Technical Working Party on Automation and Computer Programs (TWC) for visually-assessed characteristics to the revision of the Test Guidelines for Sunflower.

(e) It proposed to amend the annexes to the Test Guidelines for Barley, Maize and Wheat in the electrophoretic characteristics by adding new alleles or correcting some of the alleles indicated. Some further alleles will require another ring test.

(f) It took note of the completion or improvement of the latest documents on COYD (Combined Over-Years Distinctness) Analysis and COYU (Combined Over-Years Uniformity) Analysis. It agreed that the COYD and COYU analyses were prepared in principle for cross-fertilized species only, although nothing prevented their application also to self-fertilized crops if all other conditions were fulfilled. Likewise, nothing prevented the application of document TWC/11/16, in principle prepared for self-fertilized crops, to cross-fertilized crops if all other conditions were fulfilled.

(g) It agreed that it was important to work on the harmonization of methods of image analysis and the interpretation of the data recorded and it will follow the work of the Subgroup on image analysis of the Technical Working Party for Ornamental Plants and Forest Trees (TWO).

(h) It held detailed discussions on the different degrees of involvement of the breeder in the testing of varieties and noted that COMASSO (Association of Plant Breeders of the European Economic Community) had expressed its preference for testing done by government authorities.

(i) It recommended to the Committee to propose to the Council that it elect Mr. Aubrey Bould (United Kingdom) as chairman of the Technical Working Party for Agricultural Crops (TWA) for the coming three years.

5. The twenty-sixth session of the TWA will be held in Montevideo, Uruguay, from November 10 to 14, 1997. During its twenty-sixth session the Working Party plans to complete, for presentation to the Committee for adoption, the Test Guidelines for Soya Bean (Revision) and to discuss or rediscuss working papers on Test Guidelines for Lotus, Rice (Revision), Cotton (Revision), Bromus, Subterranean Clover, Sunflower (Revision) and Tobacco. On Opium Poppy, it hopes to be able to reach agreement with the Technical Working Party for Vegetables (TWV) by correspondence. In addition to Test Guidelines, it is planned to discuss the following items: UPOV-ROM Plant Variety Database, prescreening of varieties, use of electrophoresis in ryegrass, new alleles for maize, ear rows versus drilled plots, sequential analysis, image analysis and cooperation with breeders in the testing of varieties.

Progress Report on the Work of the Technical Working Party on Automation and Computer Programs (TWC)

6. Mr. S. Grégoire (France, Chairman of the TWC) reported that the Technical Working Party on Automation and Computer Programs had held its fourteenth session in Hanover, Germany, from June 4 to 6, 1996. The full report on that session appears in document TWC/14/19. The main elements arising from the session are as described below.

- (a) UPOV-ROM demonstration disc: It appreciated the progress made in the preparation of the UPOV-ROM demonstration disc and answered some open questions.
- (b) DUST program from the United Kingdom: It noted the inclusion of the DUST program prepared by Mr. C. Weatherup, United Kingdom, in the computer systems of several member States, its translation into their national languages and its application. It will ask more experts to check whether the translations have kept the original functions unchanged.
- (c) Possibilities of biometry in the establishing of Test Guidelines: It discussed the different methods available to evaluate the usefulness of given characteristics in Test Guidelines and offered its help to other Technical Working Parties.
- (d) Population standard: It held lengthy discussions and will continue discussing the selection of the correct population standard and the difficulties experienced by certain crop experts in choosing a population standard.
- (e) Improvement of communication: It discussed the possibilities of improving the perception of statistical documents and the improvement of communication. It approved the rewritten documents on the COYD method, and on the testing of uniformity according to document TWC/11/16. It approved the document on the COY analysis for presentation to the Committee for approval. The rewritten document TWC/11/16 will require further changes. It updated information on telecommunication and exchangeable software and the list of documents prepared by the TWC.
- (f) Items resulting from the BMT: It discussed several methods resulting from a request made during the last session of the BMT. As a result three documents will be pursued at the next session of the BMT on the following subjects: (i) similarity, clustering and

dendograms; (ii) statistical methods to distinguish varieties with data resulting from biochemical or molecular techniques; (iii) use of the Analysis of Molecular Variance (AMOVA) for distinctness studies.

(g) World Wide Web (WWW): It discussed certain projects for making statistical and mathematical techniques available through WWW and will follow these developments.

(h) It recommended to the Committee to propose to the Council to elect Mr. John Law (United Kingdom) as chairman of the Working Party for the coming three years.

7. The fifteenth session of the TWC will be held in Budapest, Hungary, from June 3 to 5, 1997. During that session, the TWC plans to discuss or rediscuss the following items: Report on subjects of special interest to the Working Party raised during the thirty-third session of the Committee; questions raised by other Technical Working Parties; report on new developments in member States; handling of visually-assessed characteristics: ways to analyze visually-assessed characteristics and possibilities of using biometry to help in the establishment of guidelines with respect to visually-assessed characteristics; testing of uniformity: finding the right population standard and decision rule for different sample sizes and guide to help in finding the right method to be used; sequential analysis; items resulting from the last session of the BMT: use of dendograms, AMOVA and statistical methods to distinguish varieties with data resulting from biochemical or molecular techniques; image analysis; improvement of communication: improvement of statistical documents, telecommunications, exchangeable software and contacts, list of statistical documents prepared by the TWC, list of statistical documents containing recommendations or methods of possible interest to the Technical Working Parties, glossary of definitions, results of the run of the COYD program distributed on diskette during the TWC session to check whether national implementations concord with the latest version of DUST, and developments in the World Wide Web; detection of outliers by multivariate analysis to the validation of data.

Progress Report on the Work of the Technical Working Party for Fruit Crops (TWF)

8. Mrs. E. Buitendag (South Africa, Chairman of the Technical Working Party for Fruit Crops) reported that the TWF had held its twenty-seventh session in Tel Aviv, Israel, from April 22 to 26, 1996. The full report is reproduced in document TWF/27/18. During the session, the TWF completed the Test Guidelines for Japanese Apricot, Loquat and Walnut (Revision) for submission to the professional organizations for comments. It furthermore (re)discussed working papers on Test Guidelines for Grape (Revision), *Prunus* Rootstocks, Citrus (Revision) and Pear. In addition to the discussions on Test Guidelines, the TWF discussed or rediscussed the following subjects:

(a) It appreciated the recent developments in the work for the setting-up of a UPOV Centralized Database and that a first production disc would be distributed in the coming month. It asked all experts to study that disc and make any comments for improvement of its use in the field of fruit crops.

(b) It appreciated the availability in electronic form of all reports of 1995 of the Working Parties and the Committee on one diskette. For the coming sessions all experts will send their proposals for documents to the Office of UPOV in electronic form.

(c) It appreciated the work of the TWC to prepare a more user-friendly document on the testing of uniformity of vegetatively propagated species.

(d) It reconfirmed the importance of the list of species in which varieties are tested and its periodic updating and appreciated that the document was available in electronic form.

(e) It rediscussed the definition of an off-type proposed to the Committee by the Technical Working Party for Ornamental Plants and Forest Trees (TWO) and, in agreement with the TWO, will propose the following definition to the Committee: "Each plant which shows a clear mutation in any characteristic is considered to be an off-type."

(f) It noted a first draft for the definition of categories of characteristics and added for submission to the Committee a definition of grouping characteristics.

(g) It collected information on national listing and on provisional protection in the individual member States.

(h) It agreed to coordinate its revision of the Test Guidelines for Grape with the revision of similar documents planned by IPGRI (International Plant Genetic Resources Institute) and OIV (International Vine And Wine Office).

(i) It discussed at length whether it was at all possible to establish separate Test Guidelines for fruit varieties and for rootstocks and prepared a questionnaire to obtain more information on the problems involved.

(j) It discussed at length the need for further standardization of technical terms used in the Test Guidelines and will continue building up a list of agreed terms.

(k) It recommended to the Committee to propose to the Council to elect Mr. Chris Barnaby (New Zealand) as chairman of the TWF for the coming three years.

9. The twenty-eighth session of the TWF is scheduled to be held in Wageningen, Netherlands, from September 8 to 12, 1997. During that session, the TWF plans to complete discussions on Test Guidelines for Loquat, Mume (Japanese Apricot) and Walnut (Revision) for presentation to the Committee for final adoption. It plans furthermore to (re)discuss working papers on Test Guidelines for Apple Rootstocks, Citrus (Revision), European Plum (Revision), Grape (Revision), Kiwifruit (Revision), Pear (Revision), Pear Rootstocks, *Prunus* Rootstocks and Walnut Rootstocks. In addition, the following other items are planned for discussion: updated report from the Technical Working Party on Automation and Computer Programs (TWC) on the testing of uniformity, new methods, techniques and equipment in the examination of varieties; testing of rootstock varieties, standardization of Test Guidelines, UPOV Central Computerized Database; relation between national listing and plant variety protection.

Progress Report on the Work of the Technical Working Party for Ornamental Plants and Forest Trees (TWO)

10. Mrs. U. Löscher (Germany, Chairman of the TWO) reported that the Technical Working Party for Ornamental Plants and Forest Trees had held its twenty-ninth session in Tel Aviv, Israel, from April 15 to 19, 1996. The full report on that session is reproduced in document TWO/29/15. During the session, the TWO completed the Test Guidelines for Firelily (*Cyrtanthus*) and Serruria and amendments to the Test Guidelines for African Violet, prior to their submission to the Committee for final adoption. It also completed the Test Guidelines for Bouvardia, prior to their submission to the professional organizations for comments. It furthermore (re)discussed working papers on Test Guidelines for Cymbidium, Kangaroo Paw, Lavender and Lavendine. In addition to the discussions on Test Guidelines, the TWO discussed or rediscussed the following subjects:

- (a) It discussed in detail the use of image analysis in DUS testing of ornamental plants. Its main interest lay in the use of image analysis for the faster measuring of existing characteristics, for the storage of the data, their use for the selection of similar varieties as well as for the storage of photos in digitalized form. It would set up a special subgroup of experts doing the actual research which would report to the Working Party during its next session.
- (b) It appreciated recent developments in the work on setting up a UPOV Central Computerized Database and that a first production disc would be distributed in the coming month. It asked all experts to study that disc and make some comments for improvement of its use in the ornamental field.
- (c) It reconfirmed the importance of the list of species in which varieties are tested and its periodic updating.
- (d) It proposed to make available UPOV documents in electronic form. The ideal situation would be if all UPOV documents or at least all Test Guidelines and some other important documents with no restrictions on distribution could be made available on Internet or on the monthly UPOV-ROM. Until UPOV has taken a final decision on its policy, documents should be made available in electronic form on request.
- (e) It proposed an amended definition of off-type reading: "Each plant which shows a clear mutation in any characteristic is considered to be an off-type." Impurities would be considered off-types in the same way as any other plant falling under the above definition.
- (f) It repeated its request to include the request for trade names in the Technical Questionnaires.
- (g) It considered that there was a strong need for further harmonization of technical terms in the Test Guidelines and in the use of states of expression of characteristics which for one and the same wording would have to be handled quantitatively or qualitatively depending on the specific situation.

(h) It will pay more attention to seed-propagated ornamental varieties and will study the comparative trials of Fleuroselect of new varieties set up by breeders in some European countries.

(i) It recommended to the Committee to propose to the Council to elect Mr. Joost Barendrecht (Netherlands) as chairman of the TWO for the coming three years.

11. The thirtieth session of the TWO is scheduled to be held in Denmark, from September 1 to 5, 1997. During that session, the TWO plans to complete the Test Guidelines for Bouvardia for submission to the Committee for final adoption. It will also discuss or rediscuss Test Guidelines for Chrysanthemum (Revision), Cymbidium, Cypressus, Geralton Wax Flower, Guzmania, *Hippeastrum*, Iris, Kangaroo Paw, Lavender, Limonium, Nerium, Ornamental Apple (Revision), Pentas, Petunia, Rubber, Tagetes, Thymus, Weeping Fig and *Zantedeschia*. Discussion of the following items is also planned: image analysis; new methods, techniques and equipment in the examination of varieties; central computerized database, testing of seed-propagated varieties of ornamental species and more general questions (essential derivation, novelty, discoveries, copyright of photos in variety descriptions, first applications of varieties in new species).

Progress Report on the Work of the Technical Working Party for Vegetables (TWV)

12. Mrs. E. Kristóf (Hungary, Chairman of the TWV) reported that the Technical Working Party for Vegetables had held its thirtieth session in Brno, Czech Republic, from July 8 to 12, 1996. The full report appears in document TWV/30/21. During the session, the TWV discussed and completed for presentation to the Committee for final adoption draft Test Guidelines for Beetroot (Revision), Ginger, Leaf Chicory, Pumpkin and Spinach (Revision). The TWV also discussed (partly in subgroups reporting to the Working Party) and completed for submission to the professional organizations for comments draft Test Guidelines for Cornsalad (Revision), Garlic, Onion (Revision) and Shallot, Rhubarb (Revision) and Welsh Onion/Bunching Onion. In addition to the discussions on Test Guidelines, the TWV discussed or rediscussed the following other subjects:

(a) It noted the recent developments in the work on the setting-up of a UPOV Central Computerized Data Base.

(b) It noted some corrections to be made in the Test Guidelines for Cucumber/Gherkin and for Peas.

(c) It noted the use of different denominations and/or trade names in different countries for the same variety, partly in order to prevent parallel imports from other countries which had led to confusion among growers but apparently was legal in certain countries.

(d) It noted differences in the forms and number of characteristics used for DUS testing for UPOV, for national lists, for the Community Plant Variety Office of the European Union (EU) or for the EU Catalogue and asked whether further harmonization might not be possible.

(e) It discussed how to reach more harmonization in the wording and giving of Notes to states of expression in the Test Guidelines and agreed on certain preferred words and Notes for frequently occurring cases. It will continue looking for more systematic ways of presenting characteristics.

(f) It noted that in several States applications for protection for GM varieties had been received or were already under test.

(g) It discussed the possibility of applying relative uniformity in the case of self-fertilized varieties to certain rather important characteristics in which the normal requirements for uniformity could not be met.

(h) It discussed how to assess uniformity of environment-dependent important characteristics in self-fertilized species and proposed that in the case of crops where characteristics such as shape or size had an environmental component in their expression, they should be considered in the same way as the characteristics for open pollinated varieties, where only relative uniformity was assessed.

(i) It recommended to the Committee to propose to the Council to elect Mr. Baruch Bar-Tel (Israel) as chairman of the TWV for the coming three years.

13. The thirty-first session of the TWV is scheduled to be held in Valencia or Almería, Spain, from November 24 to 28, 1997. During that session, the TWV will discuss, with a view to submission to the Committee for final adoption, Test Guidelines for Cornsalad (Revision), Garlic, Onion (Revision) and Shallot, Rhubarb (Revision) and Welsh Onion/Bunching Onion. As the next session will take place only after the session of the Committee, the Working Party will try to reach agreement on comments to the above Test Guidelines by correspondence, in which case they will already be presented to the Committee for adoption in 1997. It will furthermore discuss or rediscuss, as time permits, working papers on Test Guidelines for Black Radish (Revision), Broad Bean (Revision), Celeriac (Revision), Celery (Revision), *Cucurbita moschata*, Curly Kale (Revision), Dill, Fennel, Globe Artichoke, Industrial Chicory, Kohlrabi (Revision), Leek (Revision), Lentil, Okra (*Abelmoschus esculentus*), Opium/Seed Poppy, Radish (Revision), Swede (Revision), Turnip, Turnip Rape, Witlof. In addition to Test Guidelines, it is planned to discuss the general presentation of Test Guidelines and Genetically Modified (GM) varieties.

QUESTIONS PRESENTED BY THE TECHNICAL WORKING PARTIES

14. The Committee noted document TC/33/3 containing a collection of the most important items discussed and questions raised and presented to the Committee: (i) for information; (ii) for information and for a possible decision to be taken by the Committee and (iii) for a decision to be taken by the Committee.

I. MATTERS FOR INFORMATION

Information on the European Union

15. The Committee noted the following up-to-date information on the activities of the Community Plant Variety Office (CPVO) of the European Union (EU) provided by the representative. Since the CPVO has taken up duties in June 1995, four thousand two hundred applications have been filed. Around a half of the total applications have been for ornamental species, 30% have been for agricultural crops, 10% for vegetables species and 10% for fruit species. Five hundred applications have been submitted by applicants from non-EU Member States. Nine hundred varieties have been under testing in the Member States of EU and two hundred titles of protection have been granted so far. The official bulletin of the CPVO which is now on two-monthly basis, will be published monthly from 1997.

Varietal Association

16. The Committee noted the information from the expert of the EU that the comparative trial of seed rape would be made in France based on the agreement with France to be expected more or less at the end of 1997. It also noted the difficulty in handling the varietal association. The expert from France informed that they had received one application for the protection of a varietal association two years ago which was followed by long discussion from the non-technical point of view. A plant breeder's right was not granted to it, but the reason was not the fact of it being a varietal association. The experts from France, the United Kingdom, Germany and the Czech Republic supported the same idea that the components of varietal association were considered as individual varieties.

Cooperation with IPGRI and OIV

17. The Committee noted the cooperative work going on with IPGRI and OIV on the Test Guidelines for Grapes in the TWF and the initial contact established with IPGRI in the TWF. It also noted the information that the meeting on the future cooperation between IPGRI and UPOV in Rome, in April 1996, was a positive and useful exchange. The Committee confirmed that more regular contacts of a general nature and greater degree of coordination for mutual benefits would be required.

Relation Between National Listing and Plant Variety Rights System

18. The Committee noted the report by the expert from Israel in the TWF and the TWO meetings on the results of questionnaire, Circular U 2383, dated March 5, 1996, on the different procedures in the individual member States with respect to the period between the date of application and the granting of rights. The Committee, recognizing that the results can not provide complete information, agreed that the information should be read with caution as it could lead to more confusion than clarification. It was emphasized that the system of Plant Variety Protection should be kept separate from the system of national listing.

List of Species in Which Practical Knowledge has been Acquired

19. The Committee noted that the updated version of the list of species in which practical technical knowledge had been acquired (document TC/33/5) was very useful when the protection extended to the whole plant kingdom. It agreed that it should be regularly updated.

Level of Involvement of the Applicant in the Growing Tests

20. The Committee noted the explanation by the expert from New Zealand on the tendency to move away from breeder testing to official central government testing, especially in the important agricultural crops such as cereals, grasses and peas because of the heavy workload for collecting and maintaining the reference varieties and the problem of the costs. However, breeder testing is still being operated in less important agricultural crops in New Zealand. With the latter crops, the candidate variety should be taken care of by the breeder alongside the reference variety. The breeder is expected to contact the examiner of the Plant Variety Rights Office on the comparison varieties that should be included in the trial.

Testing of Agricultural Varieties

21. The Committee noted the following opinion of COMASSO on the cooperation of breeders in the testing of varieties:

- (a) the DUS test for plant variety protection and national listing should be interchangeable,
- (b) the test for DUS should be done by official authorities and
- (c) when breeders offered cooperation and supplied information, it should be taken into account for the decision on the variety.

22. The expert from ASSINSEL confirmed the position for European breeders but stated that in other situations different systems have historically developed which have their merits under those situations.

23. The Committee noted the wish of COMASSO and the information from ASSINSEL. It agreed that information from breeders should not be ignored but it could not in general be agreed beforehand that it would be taken into account for the decision. Everything had to be judged case by case.

Testing of Seed-Propagated Ornamental Varieties

24. The Committee noted the comparative trials of new varieties undertaken by breeders of Fleuroselect. Circular U 2448, dated August 5, 1996, gives more details on these trials. The experts from France referred to the trials which had been started in France by Fleuroselect. It is a contractual and laborious system for particular quality of ornamental varieties and it has

been found that it needed a high number of reference collections and the cost for the cycle of testing was very expensive. Experts from France, Germany and the Netherlands had visited the trial fields. They had been in good shape, had a good reference collection and showed good variety knowledge. The criteria used by Fleuroselect seem, however, rather close to agronomic economic value.

25. The Committee finally agreed that the TWO should discuss this matter in its next session. In the eyes of most experts it was important that at least the official observations had to be made by officials from the national authorities. Also legal aspects had to be considered. Fleuroselect was a breeders' association but it does not cover all breeders: testing is available only for members. The whole subject needs much more study before a decision could be taken on the form of involvement of Fleuroselect.

Testing Uniformity, Population Standard

26. The Committee noted the importance of remaining aware of the problem in fixing population standard and variability caused by environmental conditions. It appreciated the work of the TWC towards a better understanding of the whole question.

QALSTAT Computer Program

27. The Committee noted the information from the Chairman of the TWC that the English version of the QALSTAT program, in addition to the French version (original), was available for the national offices of the member States of UPOV free of charge. The possibility of producing German and Spanish versions of the program is under consideration. The expert from France mentioned that they were open to assistance from other countries.

Image Analysis

28. The Committee noted the information from the TWC. Details of this subject were discussed under "The Use of Image Analysis in DUS Testing."

Rewriting of Document TWC/11/16

29. The Committee noted that the document TWC/11/16 was still applicable until the new rewritten document was ready for next year.

Telecommunications, Exchangeable Software and Contacts

30. The Committee noted with appreciation the document TWC/14/10. It also noted the difficulty in updating this document.

List of Statistical Documents Prepared by the TWC

31. The Committee noted the planned work of the TWC on the separation of the documents of the TWC into three groups to make it easier to find a particular document on a given subject, although it might be difficult to make all of them fit into the three categories. They are:

- “(a) documents for purposes of learning or information of the TWC
- (b) documents that might be helpful for crop experts
- (c) documents prepared in view of planned recommendations.”

II. MATTERS FOR INFORMATION AND FOR A POSSIBLE DECISION TO BE TAKEN BY THE COMMITTEE

Impact of the Test Guidelines of the European Union on the UPOV Test Guidelines

32. The Committee noted the impact of the compulsory use by the CPVO of all characteristics in the UPOV Test Guidelines on the preparation or revision of UPOV Test Guidelines. The CPVO stated that that was a transitional period and even for that period practical solutions would be sought and efforts to prepare its own Test Guidelines based on UPOV Test Guidelines would be increased.

Trade Names

33. The Committee noted that at the time of application in most cases no denomination existed or was not even proposed. The modification of a trade name in the Technical Questionnaire would however have legal consequences and therefore the subject should be discussed in the next meeting of the CAJ, and their comments on legal aspects of trade names obtained. [The CAJ, during its session on October 21, 1996, decided against the inclusion of the trade name in the Technical Questionnaire.]

34. The Chairman of the TWO explained that the use of the trade name for ornamental plants was common, as the varieties were widespread in many countries. Some varieties have been only familiar with the trade name, such as the rose. It is useful for experts to know which trade name exists in the varieties. The chairman of the Committee added that such information would be helpful for DUS testing. The expert from Norway mentioned that rather than also using the trade name, individual States should use only the denomination in their official register to avoid confusion. This view was shared by many experts.

Use of Different Variety Denominations

35. The Committee noted the point raised in the TWV on the use of different denominations and/or trade names in different countries for the same variety. The Chairman of the Committee pointed out the necessity to think about other interactions with trade names, in those cases where two different names are given to the same variety in two different countries.

The question of the handling of the variety is often asked by people who are involved in seed certification in France. The experts from the Netherlands explained that this type of problem often occurred in vegetable crops, specially for potatoes. Their varieties are sold under different names outside the UPOV member States, e.g. in North Africa. The expert from Hungary reported on similar cases in Eastern Europe, but a UPOV member State should not accept a name other than the one used in the other member States, unless there were good reasons to do so. This is the case of a vegetable variety accepted in the EU but not protected in Hungary. The expert from France pointed out that the problem was different depending on whether it was in a member State of the UPOV or in a non-member State. If the synonym is published and circulated internationally, the problem might be solved as the breeder would lose interest in choosing different denominations.

Picture of the Variety Added to the Official Variety Description

36. The Committee noted that, in some States, a color photograph was attached to the official variety description or even formed part of it. It also noted that the concern raised regarding copyright in the photo was not a technical problem, but a legal one.

37. Several experts mentioned that a written description should be based on characteristics observed. If photos were added, they may be wrongly used as a partial description but a photo contained no information regarding the uniformity. A photo could therefore never replace a variety description. The Chairman of the TWO explained that in case of ornamentals when an application was filed with the national office, a photo attached to the description of the variety could give useful additional information about the variety. Regarding the possibility of standardization, it was held necessary to await further discussion, especially on the subject of image analysis. The expert from the Netherlands reported the technical problems caused in printing photos from a computer in the case of some colors, for example, a reddish or bluish color. He also emphasized his awareness of the problem.

38. The Committee agreed to the use of a photo for certain aspects, but only if in advance it was made clear for what purpose the photo was used. It should not be used for distinctness purposes.

Discoveries

39. The Committee noted the difficulty in handling applications for varieties of material discovered in the wild or bought in the local market of a distant country. It recognized that it had to be dealt with many legal matters to answer the questions and therefore also asked the CAJ for comments.

40. The expert from South Africa reported examples of the problem: South Africa possesses enormous genetic resources and is very sensitive to the issue. Seeds of a certain *Zantedeschia* discovered in the wild in South Africa were taken to New Zealand and protected there. South Africa was propagating that *Zantedeschia* but had had to stop exports to Europe where applications from New Zealand had been filed. Other cases can be found in *Cyrtanthus* and *Protea*. Foreign breeders have received a clonal material from the national botanic

garden of South Africa and obtained a plant breeder's right for it in some European countries. South Africa therefore has difficulty in selling the material in Europe.

41. Other experts reported on comparable cases. Each case had to be looked at on an individual basis. One problem is how the decision should be taken. If collection is a problem, then the collection process must be shown in the application. A variety taken out of a gene bank and selected may be granted plant breeders' rights. On the other hand, if rights have been granted wrongly, the decision could be corrected.

Definition of Off-Type

42. The Committee noted the discussion on the definition of off-type held in the individual Technical Working Parties. So far, the TWF and the TWO had reached the agreement on a definition, reading: "Each plant which showed a clear mutation in any characteristic was considered an off-type."

43. The Committee noted, however, that although the above definition had been agreed during the last sessions of the TWF and the TWO, after the sessions, it was pointed out by correspondence that the definition was not clear. The previously prepared word "significant" had a statistical connotation and also, significance in leaves is different from that in fruits. The word "clear" was more restricted to what can be seen visually, while "significant" includes much more than seeing. It therefore seems better to stay away from both "clear" and "significant" and search for a more general definition. If need be, which would differ depending on the genus or species under study. It was important to point out that the work done is to distinguish a variety, so the word to be chosen should be considered in relation to distinctness.

44. Some experts mentioned that crop experts needed to consider the origin of off-types: Were they in sufficiently uniform states? Was there any other reason beyond breeder? Was it an off-type or an outlayer? They proposed to leave the definition of off-type or outlayer to the experts in the Technical Working Parties. All Technical Working Parties needed more discussion on the subject and should come back with new proposals, if need be, species by species.

Admixtures

45. The Committee noted the different positions on the concept of admixture in relation to off-type. It was mentioned that an admixture was a plant which did not belong to the variety and was not clearly an off-type. In other words, a barley seed within wheat was an admixture which might have been caused by mixing or in other ways, while an off-type belongs to and comes from the variety through a genetic difference expressed in the phenotype.

46. The Committee was reminded of the definition of admixture described in the General Introduction to Test Guidelines (TG/1/2), where admixture is included in off-types. In response to this, some experts disagreed and proposed to revise the General Introduction to Test Guidelines. In the case of an obvious accidental admixture (e.g. with seed of another

variety) that should be ignored and the applicant should be given the possibility to correct the mistake while keeping his date of application. If it was not obvious, the other plants should be considered off-types. Because of these different approaches, the Committee asked the Technical Working Parties to discuss the question again and report back with concrete proposals for the definition of admixture and its handling.

Relative Uniformity in Self-Fertilized Varieties

47. The Committee noted the discussion on how to assess the uniformity of environmentally dependent important characteristics in self-fertilized species in the TWV. One expert warned that there should not be a mix of the following two clear approaches for autogamous crops and vegetatively propagated crops (one genotype in principle) and for allogamous crops (different genotypes) with statistical methods for off-types and measuring or assessing of relative uniformity. The Committee asked the TWV to clarify the problems encountered and reformulate the question on the basis of precise examples. It also asked all chairmen of the Technical Working Parties to transmit this question to the new chairmen and to discuss in each Technical Working Party.

Application of COYD to Self-Fertilized Varieties

48. The Committee noted the discussion on the application of COY method to self-fertilized species. It recalled that the COY method had been specially designed for cross-fertilized species, that nobody had actually used the COYD method for self-fertilized crops and the TWV and the TWO were reluctant to use this tool at all.

49. It agreed to recommend the use of COYD for cross-fertilized species. It asked the TWC for a tool which would help to take a decision as to the point from which in a measured characteristic, a plant in a self-fertilized species should be considered an off-type.

Preparation of Documents for Coming Sessions

50. The Committee noted the decision taken by the TWA and the TWV that the Office of UPOV should check in future one month before a given session which planned documents had been prepared and circulate a new draft agenda, deleting all items from the agenda for which no planned documents had been received at the Office of UPOV. It confirmed that this principle should be applied for all Technical Working Parties.

Test Guidelines to be Handled by Two Technical Working Parties

51. The Committee noted the difficulty in handling some Test Guidelines by two Technical Working Parties (e.g. TWA and TWV) because the approach to agricultural crops and vegetables was different depending on the country. In Hungary, Opium Poppy belongs to medicinal plants and is close to vegetables. In Denmark, it was considered an agricultural crop. The Technical Committee recalled its decision of 1994: if Test Guidelines are revised

or new Test Guidelines are prepared, two experts from two different countries should work together to prepare a draft of revised Test Guidelines and their cooperation could be by correspondence. This rule should also apply in those cases where experts from different Technical Working Parties could work together. It was necessary to establish regular close contacts between the two Technical Working Parties concerned. The Committee confirmed that each Technical Working Party should keep an eye on the work done by the other Technical Working Parties.

Working Papers on Test Guidelines for Rootstocks

52. The Committee noted the decision taken at the TWF regarding the preparation of Test Guidelines for Rootstocks. It agreed that the TWF should proceed with its work as decided, that is, prepare the questionnaire to obtain more information on the present situation of Rootstocks. Then prepare examples, for each of the possible solutions, study them well to find the best answer to whether to prepare one common Test Guidelines document for Rootstocks, or several documents for different species. The Committee agreed to wait for the outcome to be submitted to the next session of the Technical Committee.

The Use of Image Analysis in DUS Testing

53. The Committee noted the discussions held in the TWO and the TWA before the Subgroup Meeting on Image Analysis, held at Hanover, Germany from October 1 to 2, 1996. The Chairman of the TWO gave a brief report on the Subgroup Meeting. Experts from France, Germany, the Netherlands and the United Kingdom had presented their reports. However, it was found that the extent of the progress in this field was depending on each country: in some countries substantial progress has been made but in others, the work has just started. Image analysis was a very useful and important tool for ornamental plants in assessing an existing variety, in a reference collection, that was similar to the candidate variety. Any country which wants to join the study would be welcomed.

54. The experts from the United Kingdom expressed their concern at the relationship between image analysis and manual measurement by the experts. The Committee understood that they were now studying only the characteristics listed in the Test Guidelines and not studying possible new characteristics. The aim was to reproduce characteristics in the Test Guidelines and to replace measurements done by hand or visually by machine. It noted that the utilization of image analysis techniques could spread the workload better in the management of the reference collection. Although it seems very difficult to achieve full harmonization in some areas, it is necessary and would be possible. The Committee appreciated the work of the TWO and its Subgroup and asked to be kept informed of their progress.

Sequential Analysis

55. The Committee noted the rather negative reaction of the TWF, the TWO and TWV in seeing the means of applying the sequential analysis method. The Chairman of the TWC

highlighted again the usefulness of sequential analysis for the purpose of reducing work and the possibility of creating greater certainty by reducing the sample size to be used in the testing of uniformity. The Committee confirmed the necessity of looking further into sequential analysis. It asked the TWC to do more educational work on sequential analysis to explain the tool better and to examine more the possibility for its use.

Report on New Developments in the Electronic Area in Member States

56. The Committee noted the reports made by experts in the TWC and the TWV on recent developments in the electronic area in their countries. The expert from ASSINSEL appreciated the work done by the Office of UPOV so far, in this area, and encouraged it to continue.

UPOV Documents in Electronic Form

57. The Committee noted the wishes of the experts of some Technical Working Parties that all UPOV documents be available in electronic form in the future. However, if all documents were to be prepared in electronic form, a lot of additional work would be needed. So it seems better to think about the plan in the long term and distribute certain limited documents only on request.

58. The Committee agreed to the proposals of the different Technical Working Parties to make UPOV documents available in electronic form on a larger scale. Initially, a limited range of documents would be made available and only on request (e.g. technical reports). The Office of UPOV should, however, consider making the Test Guidelines and other important technical documents available in electronic form in due course. In the long run, all Test Guidelines should be made available on diskette or possibly even on the UPOV-ROM.

59. The expert from ASSINSEL also asked that UPOV should think about the question of availability of the UPOV-ROM to the professional organizations. The Office of UPOV answered that in the next session of the Council the availability of the UPOV-ROM to the general public would be discussed.

UPOV-ROM Plant Variety Database

60. The Committee noted the latest information on the UPOV-ROM plant variety database by the Office of UPOV, that the second production disk would be available in three or four weeks and the third one would, if possible, be available before the end of this year. It was also explained that the second part with the original data was only for the national authorities of the member States so as to avoid its commercial exploitation. The third part contained important texts including the different Acts of the UPOV Convention. The Committee appreciated the availability of the UPOV-ROM. Some experts asked to consider including also technical documents in the UPOV-ROM.

Visually-Assessed Characteristics

61. The Committee noted the offer made by the TWC and that the TWA would continue to study the application of the method to sunflower.

Acceptance Probability Curves to Define an Appropriate Sample Scheme

62. The Chairman of the TWC introduced document TWC/14/4 on acceptance probability curves, to define an appropriate sample scheme, prepared by him on the basis of uniformity studies on varieties. The Committee appreciated the instructive concrete presentation which helped to better understand the problem of selecting the appropriate sample scheme.

Consequences of the Introduction of New Characteristics for Already Protected Varieties

63. The Committee noted the long discussion by the TWA on the possibilities and consequences of using electrophoretic characteristics for testing uniformity of ryegrass. The possibility of using a difference in frequencies of alleles to establish distinctness would require the breeder of an earlier similar variety to maintain his variety with fixed frequencies of alleles. In ryegrass, the existence of tetraploidy would be a further complication in finding the correct number of plants to be tested. The Committee recognized the complex nature of this subject. What would happen if the first variety shifted in the previously non-observed characteristics, towards the new variety, in a way that would reduce the difference between the two varieties to below its acceptable minimum?

64. The expert from ASSINSEL explained that ASSINSEL was studying the list of characteristics, especially the "last resort characteristics," and had started an inquiry to its members before sending a proposal to UPOV. The expert from France also reported on the discussions in the EU on the link between last resort characteristics and uniformity characteristics for all varieties in reference collections. Breeders wondered whether distinctness can be established by last resort characteristics only. The expert from ASSINSEL mentioned that distinctness was based on stability and stability would not be preserved without breeding pressure.

65. The Committee finally agreed that more studies were necessary and that it would await the report from the TWA on its discussions during its coming session. In no way should the TWA consider itself under pressure to accept a new method only because so much effort had already been put into its study. If it creates more problems than it solves, the method should be abandoned. Although the Secretariat of UPOV expressed the concern that the Committee might expect too much of the CAJ, and the difficult questions could not be answered even by them, the Committee agreed to obtain the views of the CAJ.

III. MATTERS FOR DECISIONS TO BE TAKEN BY THE COMMITTEE

Transgenic/GM Varieties

66. The Committee reconfirmed its decision to include, subject to the approval by the CAJ, in the Technical Questionnaire of the Test Guidelines for Rape Seed and in future in other relevant Technical Questionnaires, a broad question whether the variety would "require authorization for release under legislation concerning especially the protection of the environment, human and animal health in the country in which the application is made" and whether such authorization had been obtained. The question was not intended to be limited to GM varieties but to elicit information where appropriate on other restrictions on release.

[The CAJ during its session held on October 21,1996, decided to amend the text as follows:

"4.3(i) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes [] No []

"Has such authorization been obtained?

Yes [] No []"

If the answer to that question is yes, please attach a copy of such authorization."]

Harmonization of States of Expression and Notes for Different Characteristics

67. The Committee noted document TC/33/8 prepared by experts from South Africa and Annex II to TC/33/3 with appreciation. It also noted discussions held at the TWF, the TWO and the TWV on the harmonization of expression and notes for different characteristics. On a proposal from the Editorial Committee, the Committee agreed on the following plan for future work: the expert from South Africa will amend the document TC/33/8 by spring of next year. The improved document will be presented at the next session of the Committee for discussion. In connection with the above document, the General Introduction to Test Guidelines (TG/1/2) will also be revised and the first task for preparing a preliminary draft for a revised version would be carried out in a group consisting of members of the Editorial Committee, the chairmen of all the Technical Working Parties and the Chairman and Vice-Chairman of the Technical Committee. The Office of UPOV will collect the information on which part of the General Introduction to Test Guidelines should be revised from the member of the above group and will send it to the expert from South Africa so that she can use it in elaborating new draft documents.

Definitions of Categories of Characteristics and the Conditions of Their Use in the Description of Varieties

68. The Committee noted the discussions in the Technical Working Parties and the necessity to clarify the proposed definitions and also study the legal issues. It agreed that the

grouping characteristics proposed by the TWF should be added and that the Technical Working Parties should continue discussions. It likewise confirmed that this matter should also be discussed in the CAJ and that it would await the outcome of the discussions in the CAJ before continuing on this subject.

69. The Committee also noted the discussion on disease resistance characteristics. The Chairman of the TWV explained that it has been a goal for vegetable breeders to breed vegetable species resistant to fungus, virus and other diseases. Many vegetables varieties are morphologically very similar. Due to the fulfillment of marketing requirements, the disease resistance characteristics such as Bremia are useful in distinguishing varieties and necessary for variety description. Vegetable experts are using the resistant characteristics in the Test Guidelines but without an asterisk. It would be difficult to make the characteristics generally obligatory and decisions should be taken case by case. It is important that the progress of plant breeding should not be impeded, specially in vegetable crops. The Chairman of the Committee commented that the resistance characteristics were useful in establishing distinctness but it was difficult to add them to grouping characteristics. Other experts supported this idea. Others expressed concern about the usefulness of the disease resistant characteristics and the cost for testing. Now, with the electrophoresis used for agricultural crops, the resistance characteristics become less useful. The Office of UPOV was asked to prepare a comprehensive questionnaire on how each country is using resistance characteristics, including the methodology, the list of races and the cost. The chairmen of the Technical Working Parties were asked to help in proposing the questions. Each Technical Working Party was asked to study this questionnaire document when ready.

Screening of Varieties

70. The Committee referred to the request from the TWA:

- (a) to discuss and give advice on the possible use of new methods (electrophoresis, DNA marker) not accepted for distinctness purposes for the screening of the reference collection and selection of varieties to be compared with candidate varieties and to find either a way of including them in the UPOV testing system and set up clear rules for prescreening or clearly express itself against such use and
- (b) to discuss and advise on how to combine characteristics (last resort characteristics) for distinctness purposes instead of using each characteristic separately.

71. Several experts mentioned that morphological characteristics are to a large degree quantitative characteristics. In assessing the necessary reference collection, many qualitative characteristics, like those of electrophoresis, can be used. If these characteristics are used, they should first be included in the Table of Characteristics. Thereafter the new methods could be used for grouping or screening of reference varieties. If the protein characteristics illustrated by electrophoresis can be used for purposes other than grouping or screening purposes, they must be included in the Table. Other experts insisted that any characteristics used for prescreening or grouping should be considered asterisk characteristics. It was thus proposed to discuss the question further in the TWA and the BMT. The Chairman of the Committee pointed out that the approach tends to be from the viewpoint of whether the

characteristics should be added or not to the Test Guidelines, but other issues such as reference collection, costs, also costs for the breeder should be taken into account. A hasty conclusion on this matter should therefore be avoided and it was necessary to look at the screening problem more carefully. The individual Technical Working Parties were therefore asked to study the subject and report to the Committee during its next session.

COYD and COYU Analysis

72. The Committee approved a revised version of the Combined-Over-Years Distinctness (COYD) criterion and the Combined-Over-Years Uniformity (COYU) criterion as contained in document TC/33/7 which replaces the version as contained in document TC/30/4 and that that version would become part of a revised General Introduction to Test Guidelines. It encouraged more States to request the DUST computer program and apply it in their own Offices.

New Methods, Techniques and Equipment in the Examination of Varieties, Including the Progress Report on the Work of the Working Group on Biochemical and Molecular Techniques and DNA Profiling in Particular

73. Mr. Joël Guiard (France, Chairman of the BMT) noted that the Working Group on Biochemical and Molecular Techniques and DNA Profiling in Particular (BMT) had not met since the last ordinary session of the Council. Its next session was scheduled to be held in Cambridge, United Kingdom, from March 11 to 13, 1997. As already reported, it was proposed to collect for that session information on a large number of ornamental plants and vegetatively propagated species. They should also cover studies on microsatellites. The documents to be prepared by different experts should, if possible, for each given crop cover the following items: (a) reproducibility of the method; (b) genetic determination; (c) costs of the method; (d) studies on the correlation of genotypic markers with phenotypic expressions (direct link, partial link, causative link or association); (e) robustness of the method, (f) knowledge of the genetic map of the species, (g) explanation why the method was considered important, (h) access to the method (patented or patent pending). The agenda for the coming session of the BMT would comprise the following items: (a) short presentation of research results on different species (Apple, Azalea, Carnation, Lolium, Maize, Oilseed Rape, Peach, Pepper, Potato, Rice, Rosa); (b) the importance of clearly defining questions to the statisticians; (c) the use of DNA profiling in prescreening as a possible tool in DUS testing; (d) the interest and value of the dendrogram analysis; (e) the analysis of the molecular variance; (f) the principal components analysis and other multivariate statistics; (g) correlation and causal linkage between DNA markers and morphological traits; (h) relation between molecular genetic distance and morphological distance; (i) position of the breeders on DNA profiling; (j) possibilities and consequences of the introduction of DNA profiling methods for DUS testing; (k) control of uniformity in characteristics obtained with biochemical or molecular markers; (l) effect of breeding schemes and parentage on the required distance between varieties; (m) the use of DNA profiling methods by expert witnesses in disputes on essential derivation.

74. The Chairman informed the Committee that it was intended to issue the invitations to the BMT session rather soon. A preliminary list of agenda items to be discussed was distributed during the session. As for the other Technical Working Parties, it was also agreed for the BMT that only those documents could be discussed during the session which had been received by the Office of UPOV one month before the session. This fact would be stated clearly in the invitations.

Test Guidelines

75. During the session, the Committee adopted the following Test Guidelines or amendments to Test Guidelines after having agreed on changes proposed orally by the Editorial Committee.

TG/36/5(proj.)	Rape Seed/Colza/Raps/Colza
TG/55/5(proj.)	Spinach/Epinard/Spinat/Espinaca
TG/60/5(proj.)	Beetroot/Betterave rouge/Rote Rübe/Remolacha de mesa
TG/153/2(proj.)	Ginger/Gingembre/Ingwer/Jengibre
TG/154/2(proj.)	Leaf Chicory/Chicorée à feuille/Blattzichorie/Achicoria de hoja
TG/155/2(proj.)	Pumpkin/Potiron, Giraumon/Riesenkürbis/Calabaza, Zapallo
TG/156/2(proj.)	Firelily/Cyrtanthus/Cyrtanthus/Cyrtanthus/Cyrtanthus
TG/157/2(proj.)	Serruria/Serruria/Serruria/Serruria/Serruria
TC/33/4	African Violet/Saintpaulia/Usambaraveilchen/Saintpaulia (Corrections/corrections/Verbesserungen/correcciones)
TC/33/6	Barley/Orge/Gerste/Cebada, Maize/Maïs/Mais/Maíz, Wheat/Blé/Weizen/Trigo (Changes of alleles/Changement des alleles/Änderungen der Allele/Cambio de alelos).

76. The Committee also agreed to delete the proposal concerning Test Guidelines for Maize in document TC/33/6.

Chairmanship

77. As the terms of office of the individual Chairmen of the Technical Working Parties were to end at the close of the forthcoming ordinary session of the Council, the Committee, on the recommendation of the individual Technical Working Parties, proposed the following experts as chairmen of the Technical Working Parties for the coming three years:

TWA:	Mr. Aubrey Bould, United Kingdom
TWC:	Mr. John Law, United Kingdom
TWF:	Mr. Chris Barnaby, New Zealand
TWO:	Mr. Joost Barendrecht, Netherlands
TWV:	Mr. Baruch Bar-Tel, Israel.

78. As no proposal had yet been made by the BMT concerning its future chairmanship, the Committee proposed to extend the chairmanship of the BMT of Mr. Joël Guiard (France) for a further year.

Program for the Thirty-Fourth Session

79. In 1997 several sessions of the Technical Working Parties are scheduled late in the year. Since this had happened several times before, the Committee proposed in future to meet in the spring and not in the autumn. The thirty-fourth session of the Committee is therefore proposed to take place in Geneva in April 1998 either in the week immediately before the sessions of the Consultative Committee and/or the Administrative and Legal Committee or in the same week as those sessions. It is planned that the following items be discussed during the session: Progress reports and questions presented by the Technical Working Parties, revision of the General Introduction to Test Guidelines and harmonization of states of expression and their notes, new methods, techniques and equipment in the examination of varieties. In addition, the Committee will take decisions on the Test Guidelines which will be submitted by the Technical Working Parties for final adoption.

Status of Test Guidelines

80. The Annex to this document contains an updated account of the status of Test Guidelines as of October 22, 1996.

81. *The present report has been adopted by correspondence.*
