Molecular techniques: Application in DUS testing

Experience in France

Groupe d'Étude et de contrôle
des Variétés Et des Semences

Molecular techniques: application in DUS testing Experience in France

According to the approved UPOV models

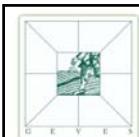

➤ Characteristic-specific markers

- Detection of gene Hs1 pro-1 controlling resistance to nematode *Heterodera Schachtii* in Sugar beet varieties (**routinely used**)
- Detection of genes Tm1, Tm2 and Tm2² controlling resistance to mosaic virus in Tomato varieties (**supporting tool in case of doubt**)
- Detection of adventitious presence of GM seeds (**routinely used**)
- Detection of genes controlling resistance to *Meloïdogyne incognita*, *Verticillium* and *Fusarium oxysporum* in Tomato and resistance to mosaic virus in Lettuce (**still under development**)

UPOV Technical Committee Geneva March 2013

2

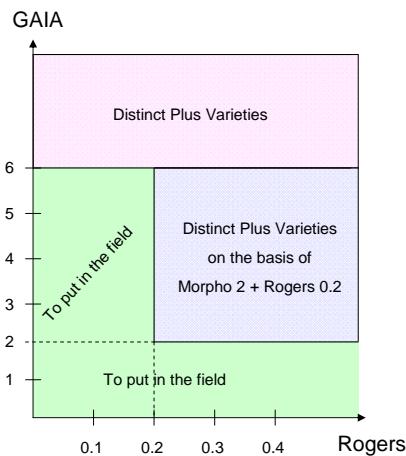

Groupe d'Étude et de contrôle des Variétés Et des Semences

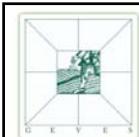

According to the approved UPOV models

➤ Combining phenotypic differences and molecular distance in management of reference collections

UPOV Technical Committee Geneva March 2013

3

Groupe d'Étude et de contrôle des Variétés Et des Semences

According to the approved UPOV models

➤ Combining phenotypic differences and molecular distance in management of reference collections

This model is **routinely used** by GEVES on reference
collections of:

- Maize inbred lines
- Barley
- Lettuce

Under development for other species

Benefit: 20 to 40 % of reduction of reference varieties in
the DUS trial except for Lettuce

New development: use of SNP markers in case of Maize

UPOV Technical Committee Geneva March 2013

4

Molecular techniques: other applications in France

➤ Identity control for:

- Renewal of reference samples
- Check of VCU samples
- Seed certification
- Arbitration

Not applicable to all kind of species (heterozygous varieties, mutants)
In case of differences between reference and new samples, control on phenotypic characteristics

- Check of hybrid conformity in Maize, Sunflower, Sorghum, Wheat, ...
- Description of reference collection of different species (Peach, Apricot, Wheat, Pea, Sorghum, Soybean, Poplar,).

Molecular techniques: other applications in France
