**INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS**

Geneva

**TECHNICAL COMMITTEE****Fifty-First Session  
Geneva, March 23 to 25, 2015****PARTIAL REVISION OF THE TEST GUIDELINES FOR FRENCH BEAN  
(DOCUMENT TG/12/9 REV.)***Document prepared by the Office of the Union**Disclaimer: this document does not represent UPOV policies or guidance*

1. At its forty-eighth session held in Paestum, Italy, from June 23 to 27, 2014, the Technical Working Party for Vegetables (TWV) considered a partial revision of the Test Guidelines for French Bean on the basis of documents TG/12/9 Rev. and TWV/48/29 "Partial Revision of the Test Guidelines for French Bean (Document TG/12/9 Rev.)" and proposed to revise the Test Guidelines for French Bean as follows (see document TWV/48/43 "Report", paragraph 97):

- (a) Proposal to revise characteristics 49 to 52
- (b) Proposal to include a revised format for disease resistance characteristics under Chapter 8.2

2. The proposed revisions are presented in the Annex to this document.

[Annex follows]

Proposal to Revise Characteristics 49 to 52*Current wording:*

49. (+)		Resistance to Bean anthracnose ( <i>Colletotrichum lindemuthianum</i> )	Résistance à l'anthracnose du Haricot ( <i>Colletotrichum lindemuthianum</i> )	Resistenz gegen Brennfleckenkrankheit ( <i>Colletotrichum lindemuthianum</i> )	Resistencia a la antracnosis de la judía ( <i>Colletotrichum lindemuthianum</i> )

Proposal to Include a Revised Format for Disease Resistance Characteristics

*Current wording:*

Ad. 49: Resistance to Bean anthracnose (*Colletotrichum lindemuthianum*)

Maintenance of races	In a test tube on glucose-peptone agar
Pre-germination of seed (about 4 to 5 days)	At least twice, 10 seeds are placed at 20°C in petri-dishes on moist vermiculite. After the start of germination (1 to 2 cm root length) the seed coat is removed.
Inoculum and inoculation	Growth on GPA in 1 liter glass bottles for 12 to 14 days. Removal of inoculum with a scraper. The germinated seeds are dipped in a suspension of spores of <i>Colletotrichum lindemuthianum</i> for 2 minutes. The concentration of spores should be 1 million spores per ml
Sowing:	Sowing in pots with sand, covering of seed with sand to 1 cm.
Culture of plants:	The pots are placed in a Phytotron at 20°C with 16 hours of daylight. Regular watering is needed, no special air humidity requirements.
Observation:	The symptoms are visible during sprouting of the plants or up to 10 days thereafter. The observations can be made after 10 to 14 days.
Scheme of observation:	<u>Resistance present:</u> healthy plants with no symptoms, or weak reaction with small superficial necroses in the form of dots or stripes <u>Resistance absent:</u> reaction with up to 5 necrotic flecks on stem, or strong reaction with necroses larger than 3 mm, sunk deeply into the tissue, or dying plants with strong formation of necroses during sprouting or thereafter.

proposed new wording:

Ad. 49: Resistance to “*Colletotrichum lindemuthianum*” (Cl)

1.	Pathogen	“ <i>Colletotrichum lindemuthianum</i> ” (Cl)
2.	Quarantine status	No
3.	Host species	<i>Phaseolus vulgaris</i>
4.	Source of inoculum	GEVES (FR), Naktuinbouw (NL), INIA (ES)
5.	Isolate	6, Kappa
6.	Establishment isolate identity	On differentials:

	Old race name:		-	(no longer in TG)	
	Binary race name:		6	Lambda	Kappa

7.	Establishment pathogenicity	On susceptible variety
8.	Multiplication inoculum	
8.1	Multiplication medium	PDA (Potato Dextrose Agar) or Mathur medium (20-25°C)
8.2	Multiplication variety	-
8.3	Plant stage at inoculation	Seed for soaking 5 days old seedlings for spraying
8.4	Inoculation medium	-
8.5	Inoculation method	Soaking or spraying seedlings
8.6	Harvest of inoculum	Scrape spores with scraper from 7-20 days old plates grown at 20-25°C
8.7	Check of harvested inoculum	Count spores and adjust to 10 <sup>6</sup> spores per mL
8.8	Shelflife/viability inoculum	About 4 hours Long term storage of strains: at -80°C in 20% glycerol
9.	Format of the test	
9.1	Number of plants per genotype	At least 20 plants
9.2	Number of replicates	-
9.3	Control varieties	
	Susceptible:	Goldrush, Michelet à longue cosse, Masai
	Resistant for race 6 and race Lambda:	Booster, Pastoral
9.4	Test design	-
9.5	Test facility	Climate cell
9.6	Temperature	20-22°C
9.7	Light	-

9.8	Season	-
9.9	Special measures	Plants are placed in high humidity
10.	Inoculation	
10.1	Preparation inoculum	Culture on PDA or Mathur medium
10.2	Quantification inoculum	Count spores and adjust to 10 <sup>6</sup> spores per mL
10.3	Plant stage at inoculation	Pre-germinated seed for soaking 5 days old seedlings for spraying
10.4	Inoculation method	One of two methods may be applied: - Soaking pre-germinated seeds in a spore suspension for 2 minutes. Seeds are planted in soil after inoculation - Spraying cotyledons with inoculum suspension 5 days after sowing
10.5	First observation	7 days after inoculation
10.6	Second observation	12 days after inoculation
10.7	Final observations	14 days after inoculation
11.	Observations	
11.1	Method	Visual observation of symptoms
11.2	Observation scale	0: no symptoms 1: weak reaction with small superficial necrosis (dots or stripes) 2: necrotic lesions larger than 3 mm and/or deeply sunk into the tissue of hypocotyls and/or stems 3: dying plants
11.3	Validation of test	Control varieties must show expected symptoms
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	-
	For soaking seeds:	Resistant [9]: class 0 and 1 Susceptible [1]: class 2 and 3
	For spraying cotyledons:	Some flecks of necrosis can occur in the stem and some in the cotyledons of resistant varieties
13.	Critical control points	Monitor the inoculation pressure with a suitable variety e.g. with Pastoral. This variety has a weaker resistance and can give an indication of aggressiveness of the test.

*Current wording:*

Ad. 50: Resistance to Bean Common Mosaic Necrosis Virus (BCMNV)

Production of infection material

Nature of medium:	Plants or dry leaves
Special conditions:	Glasshouse culture (plants) or deep-frozen leaves
Identification:	Use of virus strain "NL 3"
<u>Conduct of trials</u>	
Plant stage:	Two-leaf
Temperature:	Culture at 20 to 25°C, following inoculation 30°C for a period of 8 days
Light:	Normal daylight, if necessary shaded
Culture:	Glasshouse
Type of inoculation:	Mechanical, by rubbing the inoculum on the leaves

Duration of trials

- Sowing to inoculation:	8 to 9 days
- Inoculation to observation:	6 to 21 days
Number of plants tested:	60 (20 pots with 3 plants each)

Description of the Method

(1) Obtaining the inoculation material.- The virus strain "NL 3" is used for the tolerance testing since it covers practically all the groups of strains of Bean Common Mosaic Virus. To begin with, dwarf bean plants of the variety "Dufrix" or of another variety highly sensitive to the virus are infected, around the beginning of Spring, by rubbing with pressed juice containing the virus, obtained from own maintenance culture or from freeze-dried leaves (provided for instance by the Institute for Biochemistry and Virus Diseases of the Federal Biological Institute in Brunswick (= strain "NL 3")). These infected plants are then used, around two months later, for producing pressed juice containing the virus with which the test plants are inoculated.

(2) Inoculation.- The pressed juice containing the virus is diluted for inoculation (approximately one part juice to two parts water). After the two leaves have been strewn with carborundum or celite, the diluted juice is lightly rubbed on using a firm sponge. The leaves are then rinsed with water some 15 to 20 minutes later using a watering can with a fine spout.

(3) Incubation.- Following inoculation, the air temperature in the glasshouse must be kept at 30°C for at least one week. (Important!!! The temperature must be maintained throughout the day and also at night). First lesions may already occur after 3 to 4 days. Top necrosis will already become visible one week after inoculation. Varieties with tolerance absent demonstrate the typical mosaic symptoms after approximately two weeks. The final observations can be made some three weeks after inoculation.

(4) Observation: The first assessment should be made on the sixth day following the day of inoculation. The mosaic symptoms and the necrotic symptoms can be distinguished as follows:

(i) Mosaic symptoms: pale-colored leaves; light and dark green mosaic; dark green areas between veins blistered; narrow chlorotic bands along veins and leaf margin rolling downwards. Various symptoms may be expressed in various degrees. The mosaic symptoms may be recorded using a scale from 1 to 9 to assess the reaction of the candidate variety

(1 = no symptoms, 9 = strongest stage of expression). If a candidate variety does not show any mosaic symptoms, while the susceptible standard varieties do so, that candidate variety should be regarded as being resistant to mosaic.

(ii) Blackroot symptoms: there are two types of necrosis (especially when tested with strain "NL3"), which are to be classified as "Blackroot."

Local necrosis (local hypersensitivity): characterized by brown necrotic netting (the veins) localized on a part of the leaf blade;

Systemic necrosis (top necrosis): characterized by a rapid development of necrosis through out the stem, the petiole and the roots, resulting in top necrosis or even complete necrosis of the plant. (The vascular bundles of the stem, the petiole and finally the roots, if inoculated at a young plant stage, turn brown, hence the term "Blackroot").

Varieties or strains showing blackroot symptoms (both local hypersensitivity and top necrosis) generally prove to be resistant to mosaic in the field.

During the resistance testing most local necroses develop into top necroses.

Remarks:

The genetics of resistance to Bean Common Mosaic Virus (BCMV) and/or Blackroot is based on a number of a-specific and specific recessive genes of which some are allelic. Drijfhout found at least 4 genes; e.g.:

bc-u  
bc-1/bc-1<sup>2</sup>  
bc-2/bc-2<sup>2</sup>  
and bc-3.

A dominant necrosis gene 'l' interferes with these resistance genes. The recessive form 'l<sup>+</sup>' in combination with bc-3 and bc-2<sup>2</sup> gives complete resistance to both BCMV and Blackroot (Example variety: Great Northern 31).

(for more details, see Drijfhout (1978))

*proposed new wording:*

Ad. 50: Resistance to “Bean common mosaic necrosis virus” (BCMNV)

1.	Pathogen	“Bean common mosaic necrosis virus” (BCMNV)
2.	Quarantine status	No
3.	Host species	<i>Phaseolus vulgaris</i>
4.	Source of inoculum	GEVES (FR), Naktuinbouw (NL), INIA (ES)
5.	Isolate	NL3 or NL5 (Pathogenicity group VI)
6.	Establishment isolate identity	On differentials Widusa and Top Crop; Widusa (I) must show top or vein necrosis; Top Crop (bc-1, I) must show only local necrosis
7.	Establishment pathogenicity	On susceptible variety
8.	Multiplication inoculum	
8.1	Multiplication medium	-
8.2	Multiplication variety	Dufrix or Flandria
8.3	Plant stage at inoculation	First leaf expanded (8-12 days)
8.4	Inoculation medium	PBS (Phosphate Buffer Saline) and carborundum
8.5	Inoculation method	Rubbing
8.6	Harvest of inoculum	Pick leaves with mosaic and/or leaf rolling 14 days after inoculation on susceptible variety
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	Very long in dry or freeze dried leaves
9.	Format of the test	
9.1	Number of plants per genotype	20
9.2	Number of replicates	2
9.3	Control varieties	
	Susceptible:	Dufrix, Flandria
	Resistant with necrosis:	Booster, Odessa
	Resistant without necrosis:	Bizet
9.4	Test design	Glasshouse or climatic chamber
9.5	Test facility	Glasshouse
9.6	Temperature	Initial 5-7 days after inoculation: 25° day / 18°C night or 30°C day and night After 5-7 days: 25°C day and night
9.7	Light	See remark 13.
9.8	Season	-
9.9	Special measures	Rinse leaves after inoculation to reduce damage by carborundum
10.	Inoculation	
10.1	Preparation inoculum	Maceration in PBS
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	First leaf expanded (8-12 days after sowing)
10.4	Inoculation method	Rubbing
10.5	First observation	6 days after inoculation
10.6	Second observation	9 days after inoculation
10.7	Final observations	14 days after inoculation
11.	Observations	
11.1	Method	Visual observation
11.2	Observation scale	1: mosaic and/or leaf rolling 2: top necrosis, vein necrosis and/or small necrotic lesions 3: no symptoms

11.3	Validation of test	Control varieties must show expected symptoms
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	Classify in three classes corresponding with observation scale: 1: resistant absent 2: resistant present with necrosis 3: resistant present without necrosis
13.	Critical control points	Temperature-dependent expression of symptoms in some varieties, necrosis increasing with temperature. Light may also enhance symptom development.

Current wording:

Ad. 51: Resistance to Halo Blight (*Pseudomonas syringae* pv. *phaseolicola*)

Maintenance of strains

Type of medium

Infected, dry leaves

Identification:

On the basis of preliminary trials, the European strains (which probably belong to the African race-by J.D. Taylor, H.R.I. Wellesbourne) have a higher level of virulence than the US race 1 and race 2. The aggressivity of the pathogen is measured by the spot size of the pod of sensitive varieties. The isolates used for the test should cause a grease spot with a minimum diameter of 3 mm.

Execution of test

Growth stage of plants:

When the first and second trifoliolate leaves are 2 to 3 cm in length

Temperature:

Day: 24°C; night: 18°C

Humidity:

100% relative humidity until inoculated leaves are fully developed

Growing method:

In the glasshouse

Inoculum:

Bacterial suspension with a concentration of  $10^8$  bacterial cells/ml.

Method of inoculation:

Mechanical, using a camel-hair brush

Duration of test

- from inoculation to reading:

Until infected leaves are fully developed

Number of plants to be tested:

10-20 plants

Multiplication/propagation of bacteria:

Bouillon-Agar (2 g  $\text{Na}_2\text{HPO}_4$ , 2 g  $\text{NaH}_2\text{PO}_4$ , 3 g NaCl, 25 g Bouillon-Agar/1000 ml distilled water)

Remarks:

- Leaf reaction is very commonly studied nowadays. The reaction of the pod is of polygenic character, and there is no genetic linkage between leaf and pod reaction. There are as yet no varieties with pod resistance.

- Resistance means, genetically, that this host has the recessive gene with or without the presence of the modifiers; in the case where the modifiers are present the sources of these genes are: PI 150 414 (USA), CNRA-HW5A (Fr.).

It is possible to evaluate the lesions at the stage of the fully developed leaf. The different types of symptom are shown below.

Legend of illustration following hereafter

healthy tissue

water-soaked lesion without discoloration

toxically chlorotic tissue

water-soaked lesion with discoloration

some cell-size brownish red necrotic spots

Scheme of observation

Resistance absent

water-soaked lesion with toxically chlorotic halo, systemic chlorosis;  
water-soaked lesion with halo, no systemic chlorosis;  
water-soaked lesion without halo, no systemic chlorosis

discoloration of water-soaked lesions with halo, systemic chlorosis;  
discoloration of water-soaked lesions with halo, no systemic chlorosis

Resistance present

necrotic spots of 1-2 mm diameter, no systemic chlorosis or some cell-size brownish-red hypersensitive necrotic spots or healthy, uninfected plant

Proposed new wording:

Ad. 51: Resistance to “Pseudomonas savastanoi pv. phaseolicola” (Psp)

1.	Pathogen	“Pseudomonas savastanoi pv. phaseolicola” (Psp)
2.	Quarantine status	No
3.	Host species	<i>Phaseolus vulgaris</i>
4.	Source of inoculum	GEVES (FR), Naktuinbouw (NL), HRI (GB), INIA (ES)
5.	Isolate	Race 6
6.	Establishment isolate identity	All differentials should be susceptible (Canadian Wonder, A52, Red Mexican UI3, Mesunka, A53, A43, Guatemala 196-B)
7.	Establishment pathogenicity	On susceptible variety
8.	Multiplication inoculum	
8.1	Multiplication medium	King's B or Yeast Dextrose Agar at 27°C
8.2	Multiplication variety	-
8.3	Plant stage at inoculation	First leaf (9-14 days after sowing)
8.4	Inoculation medium	Tap water or saline solution (0.85% NaCl)
8.5	Inoculation method	-
8.6	Harvest of inoculum	4 days after start of pure culture
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	The number of subculturing before inoculation shall not exceed 2 and the inoculation shall be done within 2-3 days.
9.	Format of the test	
9.1	Number of plants per genotype	20
9.2	Number of replicates	2
9.3	Control varieties	
	Susceptible	Michelet à longue cosse
	Resistant	Masai, Vaillant
9.4	Test design	-
9.5	Test facility	Glasshouse or climate cell
9.6	Temperature	22/20°C day/night or 20°C day and night
9.7	Light	-
9.8	Season	-
9.9	Special measures	High humidity required during first 1-3 days after inoculation
10.	Inoculation	
10.1	Preparation inoculum	Rinse bacteria from plate with tap water and add 2 g carborundum per 100 ml or rinse bacteria with saline solution (0.85% NaCl).
10.2	Quantification inoculum	10 <sup>8</sup> cfu/ ml or 1-2 full-grown plates per 100 ml water for 100 plants
10.3	Plant stage at inoculation	First pair of leaves spreading (9-14 days after sowing)
10.4	Inoculation method	Rubbing with sponge or inoculation by spraying leaves with pressure (2 bars) until runoff. For this purpose several types of equipment may be used: atomizer or paint brush with a pressure supplier.
10.5	First observation	7 days after inoculation
10.6	Second observation	14 days after inoculation
10.7	Final observations	-
11.	Observations	
11.1	Method	Visual observation
11.2	Observation scale	
	Resistant [9]	No symptoms or necrotic pinpoints

	Susceptible [1]	<p>Light green halo around minute lesions  Water soaked (“oily”) lesions (few or many)  Water soaked lesions, later turning necrotic  Deformation and chlorosis on first trifoliolate leaves  Necrosis on stems  Dying plants</p>
11.3	Validation of test	Control varieties must show expected symptoms
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	11.2
13.	Critical control points	<p>Inoculation may produce some damage on susceptible and resistant plants.  Maintenance of isolate: beware that the colony may die after keeping 3 weeks on plate.</p>

Current wording:

Ad. 52: Resistance to Common Blight (*Xanthomonas campestris* pv. *phaseoli*), Isolate 422

Maintenance of races

Type of medium:	Infected, dry leaves
<u>Execution of test</u>	
Growth stage of plants:	When the first and second trifoliate leaves are 2 to 3 cm in length
Temperature:	Day: 26°C; night: 20°C
Humidity:	100% relative humidity during, and 1 to 2 days after, inoculation, thereafter normal relative humidity
Growing method:	In the glasshouse
Inoculum:	Bacterial suspension with a concentration of $10^8$ bacterial cells/ml.
Method of inoculation:	Mechanical, using a camel-hair brush
<u>Duration of test</u>	
- from inoculation to reading:	Until infected leaves are fully developed
Number of plants tested:	10-20 plants
Multiplication/propagation of bacteria:	20 g extract of yeast powder, 20 g glucose, 20 g CaCO <sub>3</sub> , 20 g agar-agar/1000 ml distilled water)
Remarks:	- Isolate 422 can be obtained from the Vegetable Research Institute, 1775 Budapest, P.O. Box 95, Hungary. - The reaction of pods to <i>X. phaseoli</i> is not yet clear enough today.

Legend of illustration following hereafter

althy tissue

(2) dying tissues

chlorotic tissue

(3) some cell-size brownish red hypersensitive necrotic spots

Scheme of observation

If chlorotic tissues (1) and/or dying tissue (2) are observed, the variety should be regarded as non-resistant.

If only some cell-size brownish red hypersensitive necrotic spots (3) are observed, the variety should be regarded as resistant.

Possible combinations of symptoms

Resistance absent

Resistance present

Proposed new wording:

Ad. 52: Resistance to "Xanthomonas axonopodis pv. phaseoli" (Xap)

1.	Pathogen	"Xanthomonas axonopodis pv. phaseoli" (Xap)
2.	Quarantine status	yes
3.	Host species	<i>Phaseolus vulgaris</i>
4.	Source of inoculum	Vegetable Research Institute, Budapest (HU)
5.	Isolate	Isolate 422
6.	Establishment isolate identity	-
7.	Establishment pathogenicity	-
8.	Multiplication inoculum	
8.1	Multiplication medium	Yeast Glucose Agar (20 g yeast extract powder, 20 g glucose, 20 g CaCO <sub>3</sub> , 20 g agar/ 1000 ml distilled water)
8.2	Multiplication variety	-
8.3	Plant stage at inoculation	First leaf pair 2-3 cm long
8.4	Inoculation medium	-
8.5	Inoculation method	100% relative humidity during 2 days after inoculation, later normal humidity
8.6	Harvest of inoculum	-
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-
9.	Format of the test	
9.1	Number of plants per genotype	-
9.2	Number of replicates	-
9.3	Control varieties	-
9.4	Test design	-
9.5	Test facility	
9.6	Temperature	26/20°C day/night or 28/25°C day/night
9.7	Light	-
9.8	Season	-
9.9	Special measures	100% relative humidity during 2 days after inoculation, later normal humidity
10.	Inoculation	
10.1	Preparation inoculum	-
10.2	Quantification inoculum	10 <sup>8</sup> cfu/ml
10.3	Plant stage at inoculation	-
10.4	Inoculation method	Mechanical, with camel hair brush or inoculation by spraying leaves with pressure (2 bars) until run-off. For this purpose several types of equipment may be used: atomizer or paint brush with a pressure supplier.
10.5	First observation	7 days after inoculation
10.6	Second observation	14 days after inoculation
10.7	Final observations	When infected leaves are fully developed
11.	Observations	
11.1	Method	-
11.2	Observation scale	Visual
	Susceptible [1]	Extensive necrosis sometimes surrounded by an increasing ring of chlorotic tissue
	Resistant [9]	Cell-sized brownish or red necrotic spots
11.3	Validation of test	-
11.4	Off-types	-

12.	Interpretation of data in terms of UPOV characteristic states	11.2
13.	Critical control points	-
