INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS

Geneva

DRAFT

CHESTNUT

UPOV Code(s):

CASTA_CRE; CASTA_MOL;
CASTA_SAT

Castanea mollissima Blume;
Castanea crenata Siebold & Zucc.;
Castanea sativa Mill.

*1

GUIDELINES

FOR THE CONDUCT OF TESTS

FOR DISTINCTNESS, UNIFORMITY AND STABILITY

*prepared by experts from Japan
to be considered by the Technical Committee
at its fifty-third session, to be held in Geneva
from 2017-04-03 to 2017-04-05*

Disclaimer: this document does not represent UPOV policies or guidance

Alternative names:^{*}

Botanical name	English	French	German	Spanish
<i>Castanea mollissima</i> Blume	Chinese Chestnut	Châtaignier de Chine	Chinesische Kastanie	Castaño chino
<i>Castanea sativa</i> Mill., <i>Castanea vesca</i> Gaertn., <i>Castanea vulgaris</i> , <i>Fagus castanea</i> L.	Chestnut	Chataignier	Kastanie	Castaño
<i>Castanea crenata</i> Siebold & Zucc.	Japanese chestnut	Châtaignier du Japon	Japanische Kastanie	Castaño del Japón

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

^{*} These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Castanea mollissima* Blume, *Castanea sativa* Mill and *Castanea crenata* Siebold & Zucc. and hybrids between these species.

2. Material Required

- 2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.
- 2.2 The material is to be supplied in the form of dormant shoots for grafting or two-year-old trees grafted on a rootstock selected by the testing authority.
- 2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:
 - 10 dormant shoots or
 - 6 two-year-old- trees.
- 2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.
- 2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

- 3.1.1 The minimum duration of tests should normally be two independent growing cycles.
- 3.1.2 The growing cycle is considered to be the duration of a single growing season, beginning with bud burst, flowering and fruit harvest and concluding when the following dormant period ends with the swelling of new season buds.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.4 *Test Design*

- 3.4.1 Each test should be designed to result in a total of at least 5 trees.
- 3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.1.4 Number of plants or parts of plants to be Examined

Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 5 plants or parts of plants taken from each of 5 plants and any other observations made on all plants in the test, disregarding any off-type plants.

In the case of observations of parts taken from single plants, the number of parts to be taken from each of the plants should be 2.

4.1.5 Method of Observation

The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the second column of the Table of Characteristics (see document TGP/9 "Examining Distinctness", Section 4 "Observation of characteristics"):

MG: single measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by a single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)

"Visual" observation (V) is an observation made on the basis of the expert's judgment. For the purposes of this document, "visual" observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. color charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)

For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, "G" provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity of vegetatively propagated varieties, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 5 plants, no off-types are allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be further examined by testing a new seed or plant stock to ensure that it exhibits the same characteristics as those shown by the initial material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

- 5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.
- 5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.
- 5.3 The following have been agreed as useful grouping characteristics:
 - (a) Nut: shape (characteristic 31)
 - (b) Nut: color of skin (characteristic 37)
 - (c) Nut: size (characteristic 38)
 - (d) Time of maturity for consumption (characteristic 45)
- 5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction and document TGP/9 "Examining Distinctness".

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

6.2.1 States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.2.2 In the case of qualitative and pseudo-qualitative characteristics (see Chapter 6.3), all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

State	Note
small	3
medium	5
large	7

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

State	Note
very small	1
very small to small	2
small	3
small to medium	4
medium	5
medium to large	6
large	7
large to very large	8
very large	9

6.2.3 Further explanation of the presentation of states of expression and notes is provided in document TGP/7 “Development of Test Guidelines”.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 Example Varieties

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

Example varieties are indicated its species as (A), (B), (C) after variety denomination.

(A): *Castanea sativa* Mill.

(B): *Castanea crenata* Siebold & Zucc.

(C): *Castanea mollissima* Blume

8. Explanations on the Table of Characteristics

8.1 *Explanations covering several characteristics*

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) Plant: Observations on the plant should be made in the dormant season.
- (b) Current season's shoot: Observations on the current season's shoot should be made on the middle third shoot in the dormant season.
- (c) Leaf: Observations on the leaf should be made on fully developed leaves. Leaves should be taken from the middle third of bearing shoots.
- (d) Flower: Observations on the flower should be made at full flowering time.
- (e) Bur: Observations on the bur should be made just before dehiscence.
- (f) Nut: Observations on the nut should be made on nuts mature for consumption. In case of bur containing three nuts, the middle one should be disregarded.

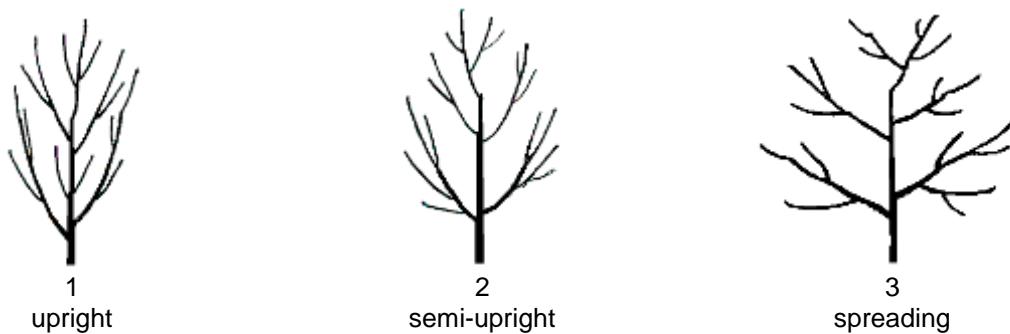

8.2 Explanations for individual characteristics

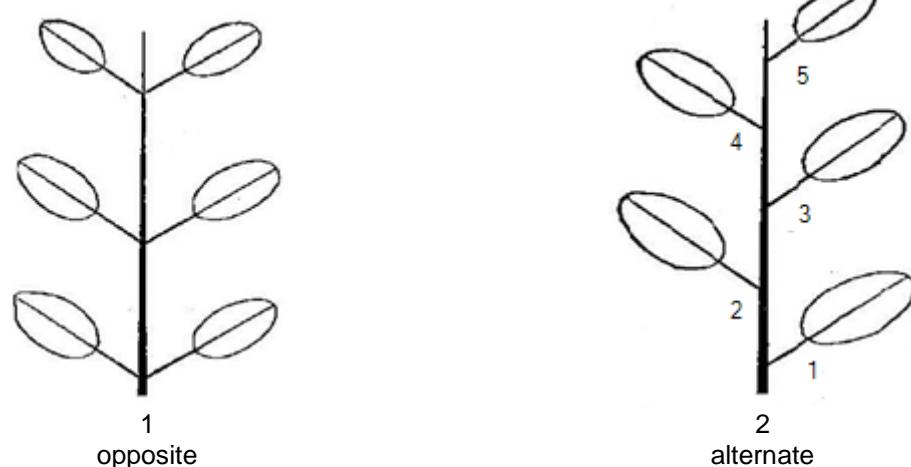

Ad. 1: Tree: vigor

The vigor of the tree should be considered as the overall abundance of vegetative growth.

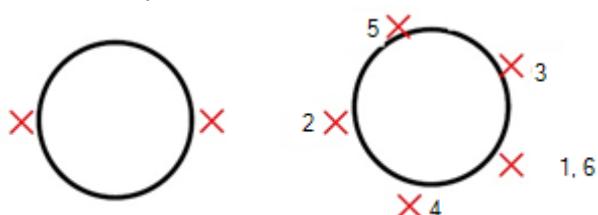

Ad. 2: Tree: growth habit

Ad. 5: Current season's shoot: arrangement of leaves

View from top on the shoot:

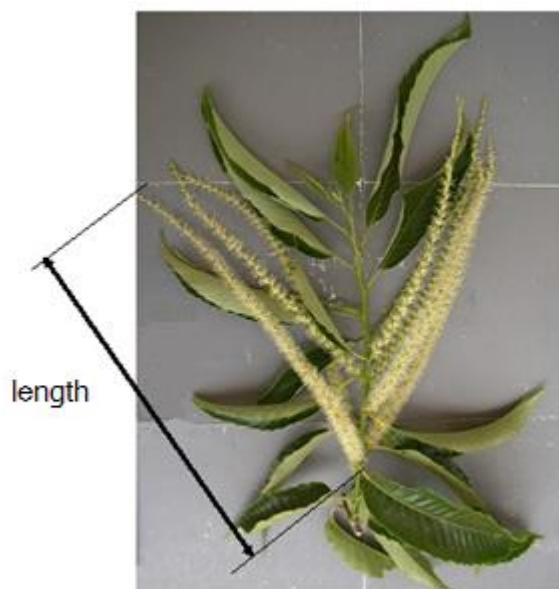

= leaf position

Ad. 8: Shoot: number of female flowers

The number of female flowers should be observed on the bearing shoots at full flowering time.

Ad. 10: Unisexual catkin: length

The length of catkin should be observed on the longest catkin at the full flowering time.

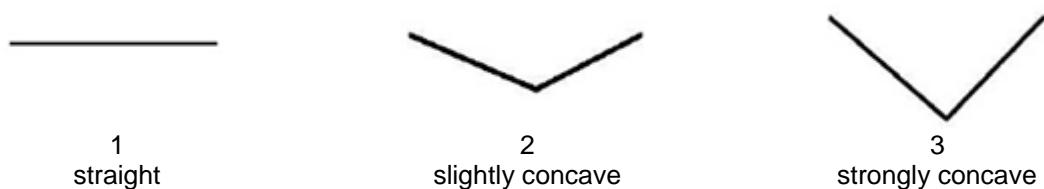

Ad. 11: Young leaf: bronze coloration

Bronze coloration of young leaf should be observed at distal part of current shoot.

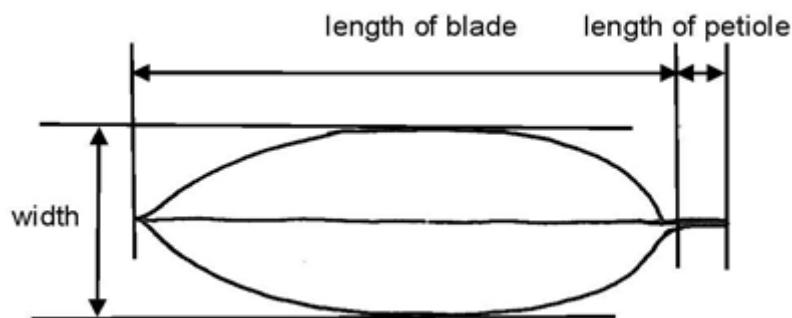

Ad. 12: Leaf: size

The size of the leaf should be observed on the leaf blade.

Ad. 13: Leaf: profile in cross section

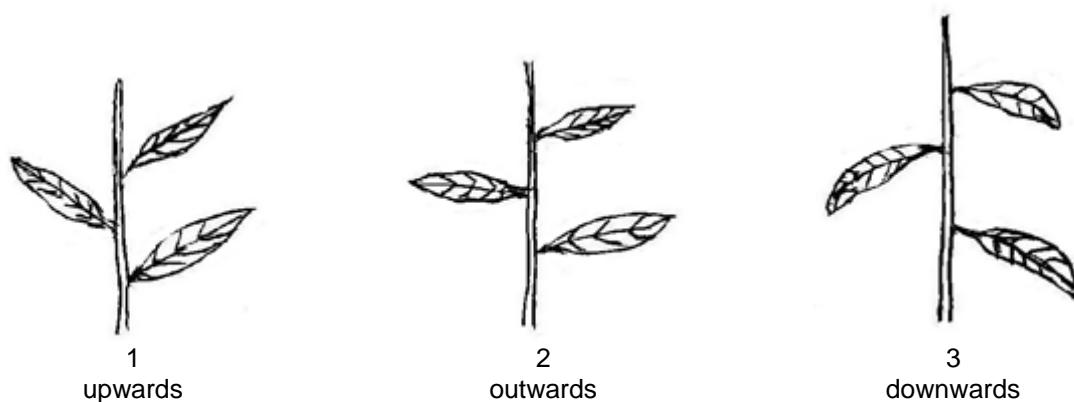

Ad. 15: Leaf: length/width ratio

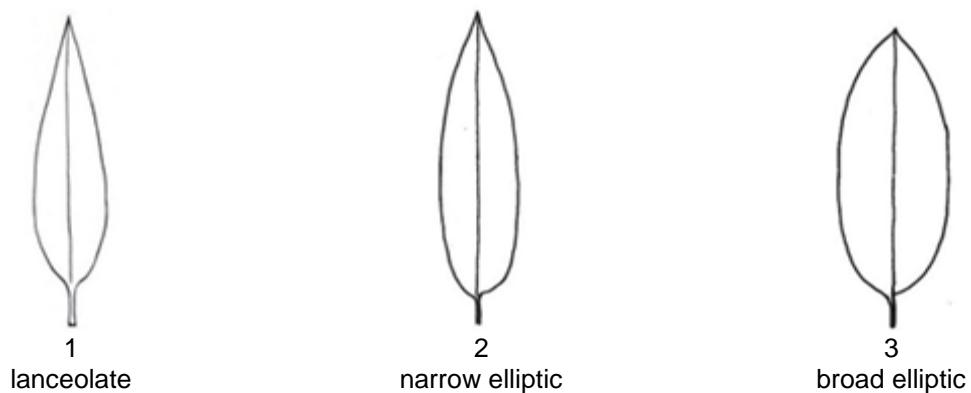

Ad. 16: Leaf: attitude in relation to shoot

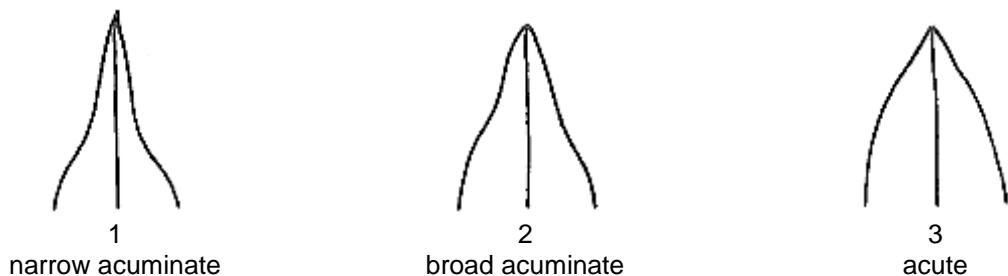

The attitude should be observed on upright shoots vertically.

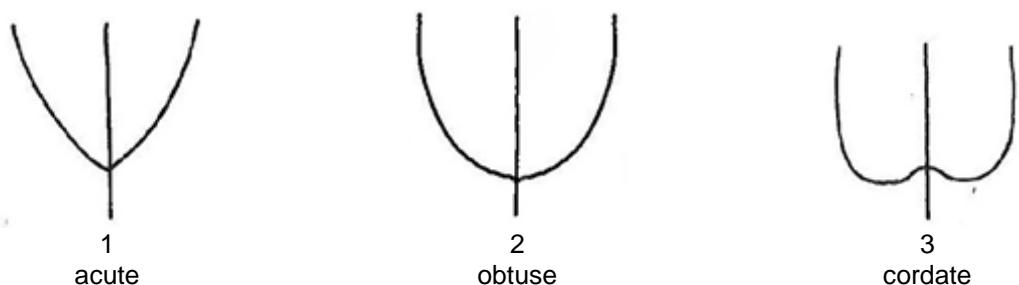

Ad. 19: Leaf: shape

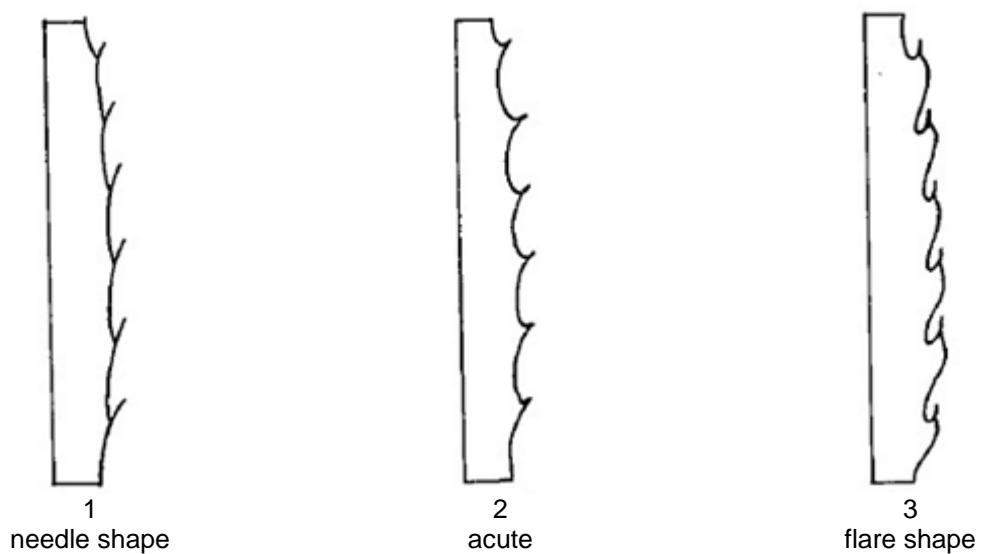

Ad. 20: Leaf: shape of apex

Ad. 21: Leaf: shape of base

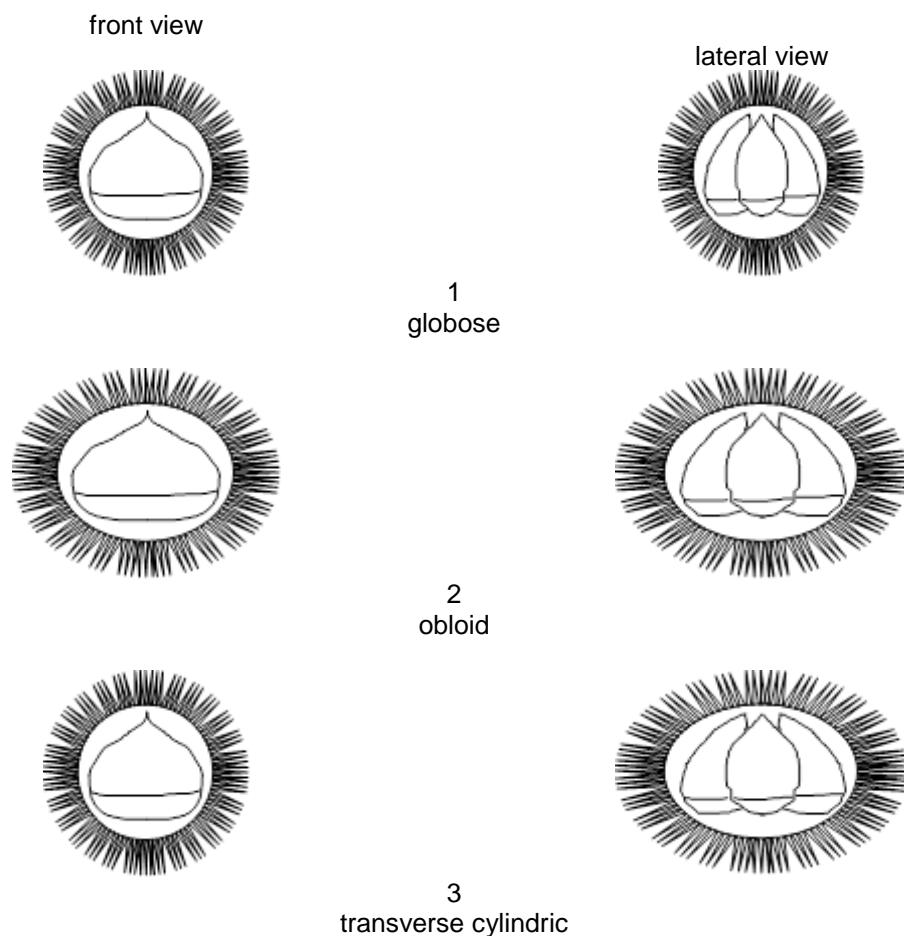

Ad. 22: Leaf: shape of margin

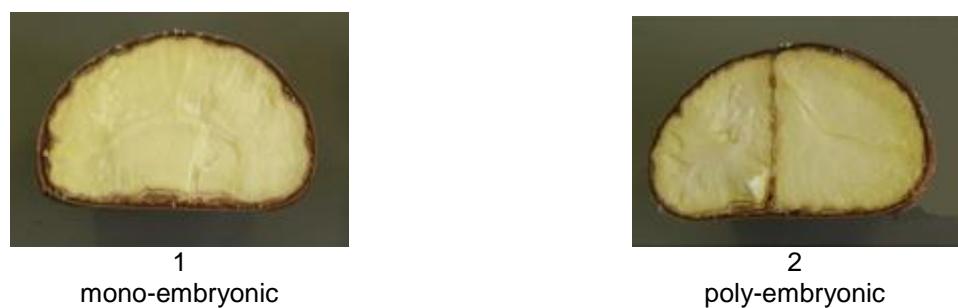

Ad. 25: Leaf: ratio length of leaf blade/length of petiole

See Ad. 15

Ad. 26: Bur: shape

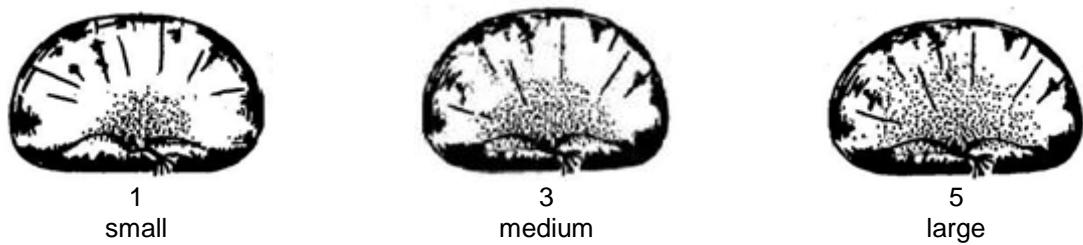

Ad. 28: Nut: embryony

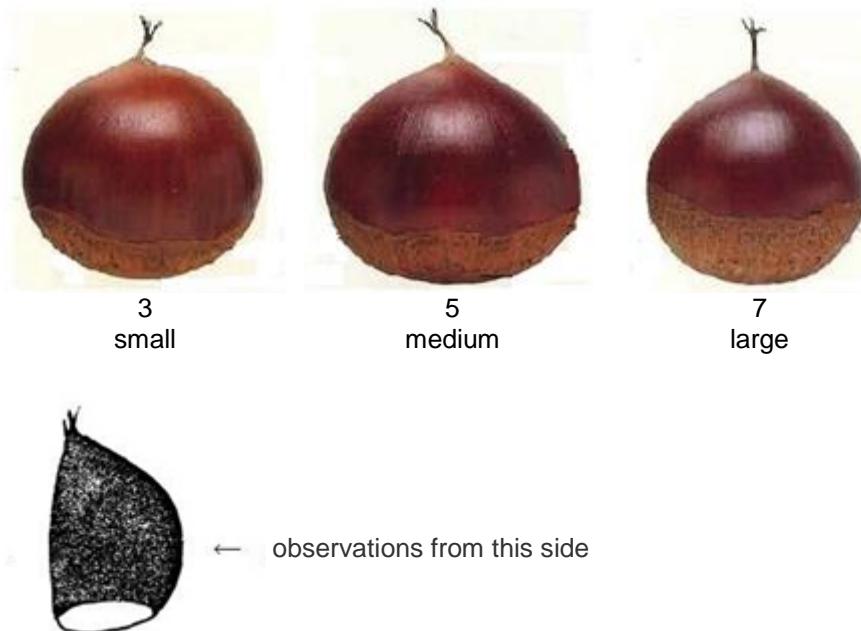

Ad. 31: Nut: shape

		← broadest part →	
		below middle at middle	
width (ratio length/width)			
narrow (high)		 2 medium ovate	
medium (medium)		 1 broad ovate	 3 circular
broad (low)			 4 medium oblate
			 5 broad oblate

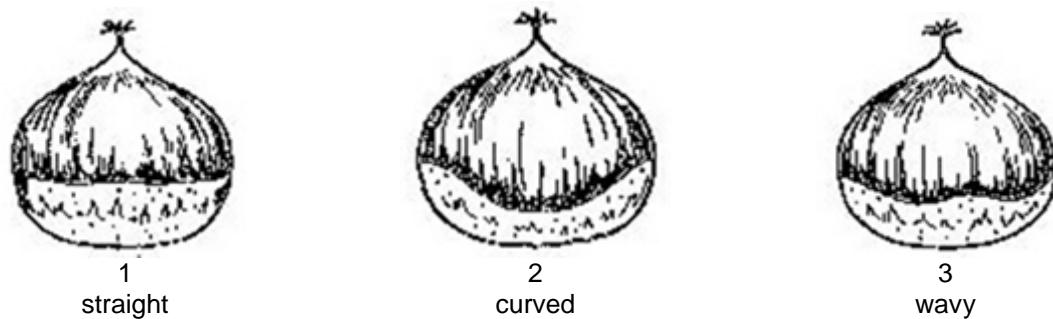

Ad. 32: Nut: area of pubescence on upper part

Ad. 33: Nut: area of hilum

Ad. 34: Nut: shape of border line of hilum and pericarp

Ad. 36: Nut: glossiness

The glossiness of nut should be observed immediately after opening of involucre.

Ad. 38: Nut: size

Observations should be made on height, width and thickness of the nut.

Ad. 39: Seed coat: adherence to kernel

The adherence to kernel should be determined by observation of the ease of peeling the seed coat by hand following steaming or roasting. Nuts should be cut in half before steaming or roasting.

Ad. 42: Time of leaf bud burst

The time of leaf bud burst is when 20% of buds show green color at the top of the bud.

Ad. 43: Time of male flowering

The time of female flowering is when 50% of the flowers are fully open.

Ad. 44: Time of female flowering

The time of female flowering is when 50% of the flowers are fully open.

Ad. 45: Time of maturity for consumption

The time of maturity for consumption is when 50% of the nuts are harvested.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:	
#7. Additional information which may help in the examination of the variety			
7.1 In addition to the information provided in sections 5 and 6, are there any additional characteristics which may help to distinguish the variety?			
Yes	<input type="checkbox"/>	No	<input type="checkbox"/>
(If yes, please provide details)			
7.2 Are there any special conditions for growing the variety or conducting the examination?			
Yes	<input type="checkbox"/>	No	<input type="checkbox"/>
(If yes, please provide details)			
7.3 Other information			

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

8. Authorization for release

- (a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes [] No []

- (b) Has such authorization been obtained?

Yes [] No []

If the answer to (b) is yes, please attach a copy of the authorization.

9. Information on plant material to be examined or submitted for examination

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | | |
|-----|---|---------|--------|
| (a) | Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes [] | No [] |
| (b) | Chemical treatment (e.g. growth retardant, pesticide) | Yes [] | No [] |
| (c) | Tissue culture | Yes [] | No [] |
| (d) | Other factors | Yes [] | No [] |

Please provide details for where you have indicated "yes".

.....

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:
