INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS

Geneva

DRAFT**LETTUCE**

UPOV Code(s): LACTU_SAT

Lactuca sativa L.

*

GUIDELINES**FOR THE CONDUCT OF TESTS****FOR DISTINCTNESS, UNIFORMITY AND STABILITY***prepared by an expert from France**to be considered by**Technical Committee for adoption by correspondence**Disclaimer: this document does not represent UPOV policies or guidance*Alternative names:^{*}

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Lactuca sativa L.</i>	Lettuce	Laitue	Salat	Lechuga

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Lactuca sativa* L.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

15,000 seeds

The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. In cases where the seed is to be stored, the germination capacity should be as high as possible and should, be stated by the applicant.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 60 plants, which should be divided between at least 2 replicates.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.1.4 Number of plants or parts of plants to be Examined

Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 20 plants or parts of plants taken from each of 20 plants and any other observations made on all plants in the test, disregarding any off-type plants.

4.1.5 Method of Observation

The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the second column of the Table of Characteristics (see document TGP/9 "Examining Distinctness", Section 4 "Observation of characteristics"):

MG: single measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by a single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)

"Visual" observation (V) is an observation made on the basis of the expert's judgment. For the purposes of this document, "visual" observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. color charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)

For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, "G" provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

4.2 *Uniformity*

- 4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:
- 4.2.2 These Test Guidelines have been developed for the examination of seed-propagated varieties. For varieties with other types of propagation the recommendations in the General Introduction and document TGP/13 "Guidance for new types and species", Section 4.5 "Testing Uniformity" should be followed.
- 4.2.3 For the assessment of uniformity of seed-propagated varieties, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 60 plants, 2 off-types are allowed.

4.3 *Stability*

- 4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.
- 4.3.2 Where appropriate, or in cases of doubt, stability may be further examined by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the initial material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

- 5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.
- 5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.
- 5.3 The following have been agreed as useful grouping characteristics:
- (a) Seed: color (characteristic 1)
 - (b) Leaf: anthocyanin coloration (characteristic 11)
 - (c) Time of beginning of bolting (characteristic 35)
 - (d) Resistance to *Bremia lactucae* (Bl) Isolate Bl: 29EU (characteristic 38)

In a first step, the collection should be divided according to types as described in the Table 1. In cases of doubt to which type a variety belongs to, it should be tested under consideration of all relevant types. The different types of Lettuce are explained in Chapter 8.3

- 5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction and document TGP/9 "Examining Distinctness".

Table 1

Type	Example varieties	Plant: degree of overlapping of upper part of leaves (Char. 3)	Leaf: number of divisions (Char. 6)	Leaf: thickness (Char. 17)	Leaf: undulation of margin (Char. 20)	Leaf: venation (Char. 25)	<u>Only varieties with Plant: degree of overlapping of upper part of leaves: medium or strong: Head: shape in longitudinal section (Char. 27)</u>
Butterhead type	Clarion, Maikönig, Sartre	medium to strong	absent or very few	thin to thick	absent to weak	not flabellate	circular or narrow oblate
Novita type	Norwick	absent or weak	absent or very few	thin to medium	very weak to medium	flabellate	-
Iceberg type	Great Lakes 659, Roxette, Saladin, Vanguard 75	strong	absent or very few	thick	absent to medium	flabellate	circular or narrow oblate
Batavia type	Aquarel, Curtis, Funnice, Felucca, Grand Rapids, Masaida, Visyon	absent or weak to strong	absent or very few	medium to thick	weak to very strong	flabellate	broad elliptic, circular or narrow oblate
Frisée d'Amérique type	Bijou, Blonde à couper améliorée	absent or weak	absent or very few	thin	absent to strong	flabellate or not flabellate or semi	-
Lollo type	Lollo rossa, Revolution	absent or weak	absent or very few	thin	strong to very strong	flabellate	-
Oakleaf type	Catalogna, Kipling, Muraï, Salad Bowl	absent or weak	few to many	thin	absent to weak	flabellate or not flabellate or semi	-
Multi-divided type	Curletta, Duplex, Jadigon, Rodagio	absent or weak	medium to very many	thin	weak to very strong	flabellate	-
Frillice type	Frilett	absent or weak	absent or very few	thick	weak to strong	flabellate	-
Cos type	Actarus, Blonde maraîchère, Pinokkio	absent or weak to medium	absent or very few	medium to thick	absent to weak	not flabellate	narrow elliptic
Gem type	Craquerelle du Midi, Sucrine, Xanadu	absent or weak to medium	absent or very few	medium to thick	absent to weak	not flabellate	broad elliptic, circular or narrow oblate
Stem type	Celtuce, Guasihong	absent or weak	absent or very few	thin to medium	absent to weak	not flabellate	-

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

6.2.1 States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.2.2 In the case of qualitative and pseudo-qualitative characteristics (see Chapter 6.3), all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

State	Note
small	3
medium	5
large	7

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

State	Note
very small	1
very small to small	2
small	3
small to medium	4
medium	5
medium to large	6
large	7
large to very large	8
very large	9

6.2.3 Further explanation of the presentation of states of expression and notes is provided in document TGP/7 "Development of Test Guidelines".

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

8. Explanations on the Table of Characteristics

8.1 Explanations covering several characteristics

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) Plant, head and stem: Observations should be made at harvest maturity. For varieties with degree of overlapping of upper part of leaves absent or weak observations should be made just before deterioration and before bolting.
- (b) Leaf: For varieties with degree of overlapping of upper part of leaves medium or strong observations should be made on the largest outer leaves, at harvest maturity. For varieties with degree of overlapping of upper part of leaves absent or weak observations should be made on the largest leaves, just before deterioration and before bolting. For Stem type varieties observations should be made on leaves at the middle third of the stem, just before deterioration and before bolting.

8.2 Explanations for individual characteristics

Ad. 3: Plant: degree of overlapping of upper part of leaves

Observations should be made on leaves at the heart of the plant to form a head.

1
absent or weak

2
medium

3
strong

Ad. 4: Only varieties with Plant: degree of overlapping of upper part of leaves: absent or weak: Plant: number of leaves

In case of doubt, observations can be made by cutting the plant in half.

3
few

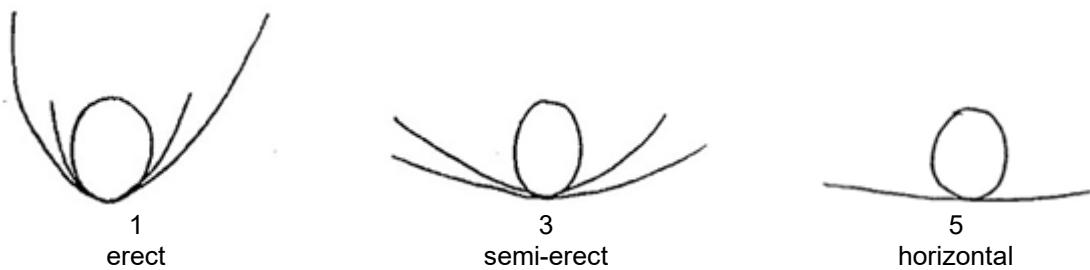

5
medium

7
many

Ad. 5: Leaf: attitude

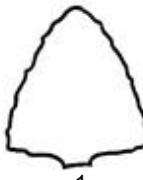

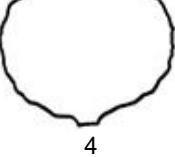

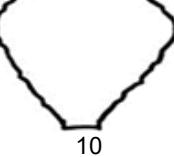

Ad. 6: Leaf: number of divisions

Observations should be made only on the incisions more than halfway to the midrib of the whole leaf.

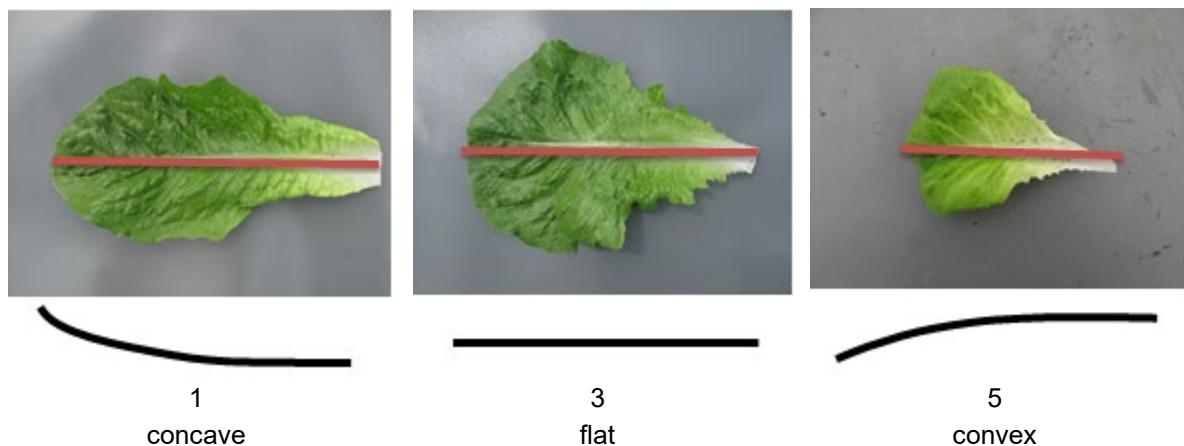

Ad. 7: Only varieties with Leaf: number of divisions: absent or very few: Leaf: shape

		< broadest part >		
width (ratio length/width)		below middle	at middle	above middle
narrow (high)			 9 linear	
	2 lanceolate		 8 narrow elliptic	 12 oblanceolate
			 7 medium elliptic	
	1 triangular		 6 broad elliptic	 11 obovate
medium (medium)			 5 circular	
			 4 narrow oblanceolate	 10 broad obtuse
broad (low)			 3 medium oblanceolate	

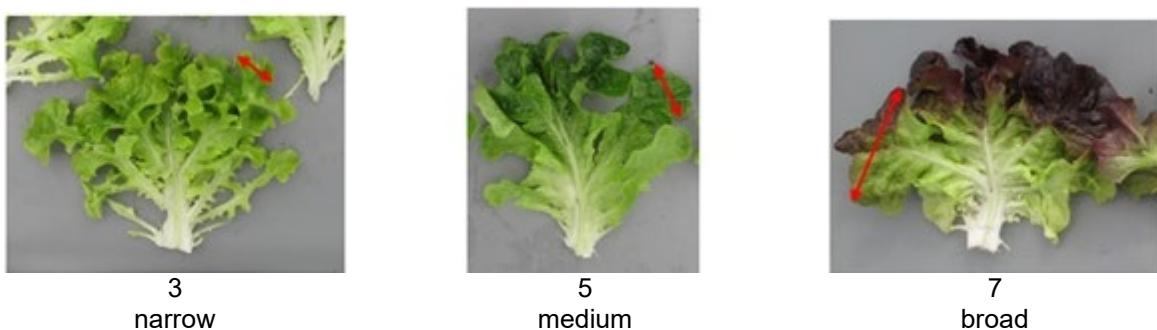

Ad. 8: Only varieties with Leaf: number of divisions: absent or very few: Leaf: shape of apex

Ad. 9: Only varieties with Leaf: number of divisions: absent or very few: Leaf: longitudinal section

Ad. 10: Only Oakleaf type varieties: Leaf: width of lobes

Ad. 11: Leaf: anthocyanin coloration

Ad. 12: Leaf: hue of anthocyanin coloration

Anthocyanin coloration (Char. 11)	Hue of anthocyanin coloration (Char. 12)		
	1 reddish	2 purplish	3 brownish
1 absent or very weak	Clarion		
3 weak	Du bon jardinier, Steirer Krauthauptel		Brauner Trotzkopf, Diablo, Maravilla de Verano
5 medium	Lollo rossa		Frisée d'Amérique, Luana, New Red Fire, Salad bowl rossa
7 strong	Jadigon		Duplex, Merveille des quatre saisons
9 very strong	Revolution	Iride	Multired 54

Ad. 13: Leaf: area covered by anthocyanin coloration

Observations should be made on the total area of diffused and/or localised anthocyanin coloration.

3
small

5
medium

7
large

9
very large

Ad. 14: Leaf: color

Ad. 15: Leaf: intensity of green color

Only to observe for green varieties and for two-colored varieties with 'Leaf: area covered by anthocyanin coloration' less than large (less than note 7 to 9), so the green color of the leaf can be observed without picking a leaf from the plant.

Intensity of green color (Char. 15)	Color (Char. 14)		
	1 green	2 yellowish green	3 greyish green
1 very light			
3 light	Blonde maraîchère, New Red Fire	Lollo Bionda, Steirer Krauthauptel	Celtuce
5 medium	Ballerina	Aquarel, Australische Gele, Dorée de printemps	Clarion, Du bon jardinier, Durango
7 dark	Actarus, Baby Star, Expedition, Verpia		Webbs Wonderful
9 very dark	Pascal, Verdetrix		

Ad. 19: Leaf: size of blisters

Observations should be made on the whole leaf.

3
small

5
medium

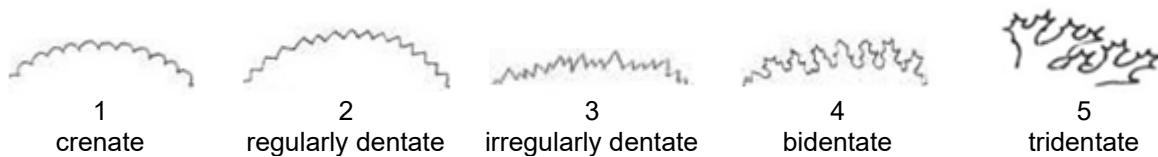

7
large

Ad. 20: Leaf: undulation of margin

Observations should be made on undulation of margin of apical part; also apical part in case of divided leaves.

Ad. 21: Leaf: type of incisions of margin

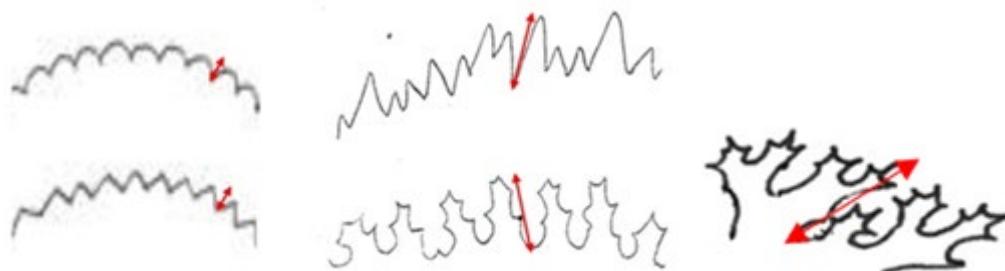

Observations should be made on incisions of the margin at the distal half of the leaf.

Ad. 22: Leaf: depth of incisions of margin

Observations should be made on incisions of the margin at the distal half of the leaf. For varieties with irregularly dentate, bidentate or tridentate incisions describe the deepest incisions and use Char. 23 for the secondary incisions.

The following drawings illustrate how to observe this characteristic for the different types of incisions.

Ad. 23: Only varieties with Leaf: type of incisions of margin: irregularly dentate, bi- or tridentate: Leaf: depth of secondary incisions of margin

Observations should be made on secondary incisions of the margin at the distal half of the leaf. In case of tridentate incisions observations should not be made on tertiary incisions of the margin (the most shallow ones).

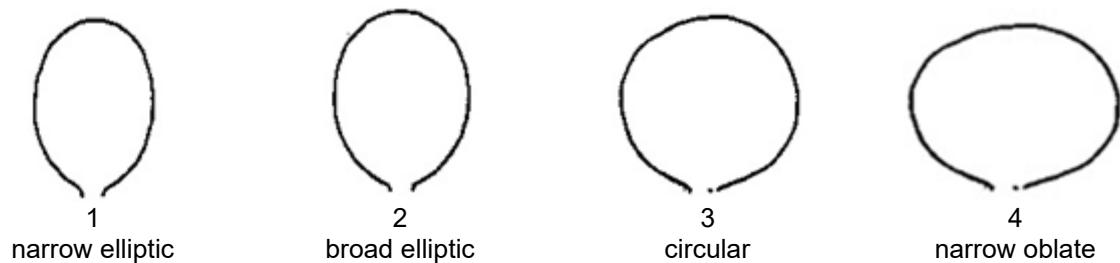

Ad. 24: Leaf: density of incisions of margin

Observations should be made on all incisions of the margin at the distal half of the leaf, so in case of irregularly dentate or bidentate both primary and secondary incisions, in case of tridentate also tertiary incisions.

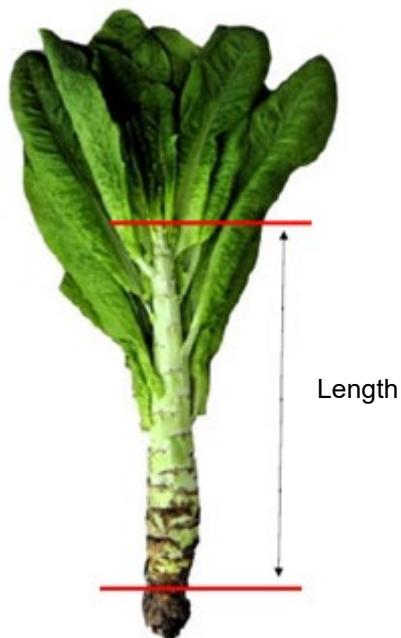

Ad. 25: Leaf: venation

Ad. 27: Only varieties with Plant: degree of overlapping of upper part of leaves: medium or strong; Head: shape in longitudinal section

Ad. 29: Only Stem type varieties: Stem: length

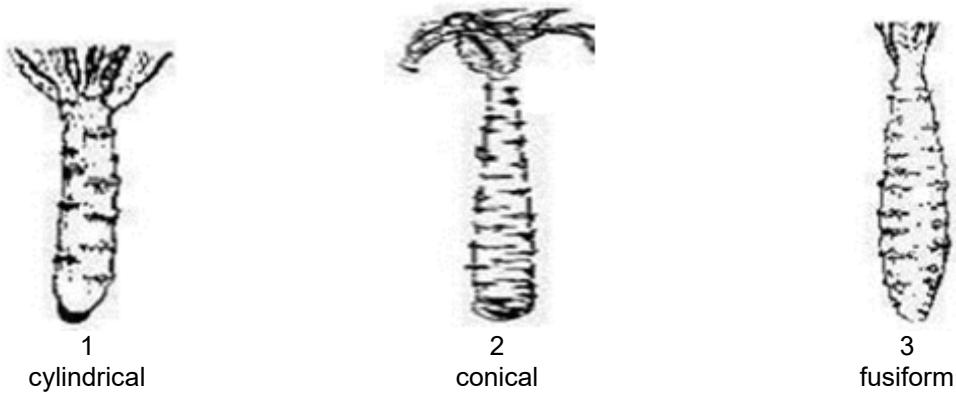

Ad. 30: Only Stem type varieties: Stem: width

Observations should be made on the broadest part of the stem.

Ad. 31: Only Stem type varieties: Stem: shape in longitudinal section

Ad. 35: Time of beginning of bolting

Observations should be made in a trial with more than 12 hours of day light as lettuce varieties need a long photo period to induce bolting.

Observations should be made when 50% of the plants start to bolt. The top of the bolting stem can be seen or felt at the top of the plant.

Ad. 36: Axillary sprouting

Formation of secondary sprouts beside the main head. Arrow points at one of the secondary sprouts.
Observations should be made in overripe stage, just before bolting.

Ad. 37: Bolting stem: fasciation

Observations should be made on the stem of bolted plants after the first flowers are open. For varieties with very late time of beginning of bolting and with strong degree of overlapping of leaves, the cover leaves of the head may be incised just before deterioration in order to be able to observe fasciation.

Ad. 38 to 43: Resistance to *Bremia lactucae* (Bl), several isolates

1.	Pathogen	<i>Bremia lactucae</i>
2.	Quarantine status	no
3.	Host species	lettuce - <i>Lactuca sativa</i> L.
4.	Source of inoculum	GEVES ¹ (FR) or Naktuinbouw ² (NL)
5.	Isolate	Bl: 29-31EU, 33EU, 35EU, 36EU
6.	Establishment isolate identity	test on differentials (see table below)
7.	Establishment pathogenicity	test on susceptible varieties

¹ matref@geves.fr

² resistantie@naktuinbouw.nl

8.	Multiplication inoculum	
8.2	Multiplication variety	susceptible variety, for example Green Towers. For isolates with a higher number than BI: 16EU, a variety with defeated resistance may be preferable to keep the isolate fit.
8.8	Shelflife/viability inoculum	2 hours at room temperature; 2 days in refrigerator
9.	Format of the test	
9.1	Number of plants per genotype	at least 20 plants
9.2	Number of replicates	-
9.3	Control varieties	(informative) differentials (see table below)
9.4	Test design	-
9.5	Test facility	climate room
9.6	Temperature	15°C-18°C
9.7	Light	adequate for good plant growth; seedlings should not be etiolated. option: reduced light 24 hours after inoculation
9.8	Season	-
9.9	Special measures	plants may grow on wet blotting paper with or without a nutrient solution, on sand or on potting soil (see point 13). high humidity (>90%) is essential for infection and sporulation.
10.	Inoculation	
10.1	Preparation inoculum	washing off from leaves by vigorous shaking in a closed container
10.2	Quantification inoculum	counting spores; spore density should be 3×10^4 - 1×10^5
10.3	Plant stage at inoculation	cotyledon stage
10.4	Inoculation method	spraying till run-off. option: reduced light 24 hours after inoculation
10.5	First observation	beginning of sporulation on susceptible varieties (around 7 days after inoculation)
10.6	Second observation	3-4 days after first observation (around 10 days after inoculation)
10.7	Final observations	14 days after inoculation two of these three observations may be sufficient, the third notation is optional for observation of evolution of symptoms in case of doubt. the day of maximum sporulation should occur in this period.
11.	Observations	
11.1	Method	visual observation of sporulation and necrotic reaction to infection
11.2	Observation scale	resistant: class 0 no sporulation, no necrosis class 1 no sporulation, necrosis present class 2 weak sporulation (much less than susceptible control) with necrosis class 3 weak sporulation (less than susceptible control and not evolving between second and third observation) with necrosis class 4 very sparse sporulation (not evolving between second and third observation) without necrosis susceptible: class 5 reduced sporulation (compared to susceptible control) without necrosis class 6 normal sporulation without necrosis
11.3	Validation of test	Validation on controls If varieties show the same level of sporulation as the susceptible control but with necrosis, another test on bigger plants or another substrate must be undertaken
12.	Interpretation of data in terms of UPOV characteristic states	class 0, 1, 2, 3 and 4: resistant class 5 and 6: susceptible

13.	Critical control points	reaction of standards (the infection pressure may vary between experiments, leading to slight differences in sporulation intensity); when the reactions are not clear the experiment should be repeated. the sowing on soil can be used to see necrosis, but weak sporulation (much less than susceptible control) can appear; when testing on sand, spores can be confused with grains of sand. in case of use of nutritive solution on blotting paper, a fungicide can be added to avoid contamination by saprophytes.
-----	-------------------------	--

For reference: The International Brearia Evaluation Board (IBEB) produces regular updates of the host differential reaction table. The most recent table is available through ISF at <http://www.worldseed.org/our-work/plant-health/other-initiatives/ibeb/>. Pictures for the observation scale are also provided.

Ad. 44: Resistance to *Lettuce mosaic virus* (LMV) Pathotype II

Resistance to pathotype II to be tested in a bio-assay (method i) and/or in a DNA marker test (method ii).

(i) Bio-assay

1.	Pathogen	<i>Lettuce mosaic virus</i>
2.	Quarantine status	no
3.	Host species	lettuce - <i>Lactuca sativa</i> L.
4.	Source of inoculum	GEVES ³ (FR) or Naktuinbouw ⁴ (NL)
5.	Isolate	pathotype II (isolates LMV-0 and Ls1 belong to the same pathotype)
6.	Establishment isolate identity	resistant and susceptible controls
7.	Establishment pathogenicity	susceptible control inoculation
8.	Multiplication inoculum	
8.2	Multiplication variety	susceptible control
8.3	Plant stage at inoculation	2-3 leaves
8.4	Inoculation medium	0,05 M PBS, 0,25% (w/v) Na ₂ SO ₃ 0,5% C ₅ H ₁₀ NNaS ₂ .3H ₂ O, 4% carborundum and 5% active charcoal
8.5	Inoculation method	rubbing; optionally repeat after 4 d; 1-2 h high humidity after inoculation
8.6	Harvest of inoculum	homogenized fresh leaf in buffer (50% w/v); freeze-dried leaves can be kept less than 1 year in storage, long term storage at -80°C
8.7	Check of harvested inoculum	compare with mock inoculation with LMV buffer + carborundum + charcoal
8.8	Shelflife/viability inoculum	2 h at 4°C or on ice
9.	Format of the test	
9.1	Number of plants per genotype	at least 20
9.2	Number of replicates	1
9.3	Control varieties	susceptible: Bijou (red), Hilde II (green), Sprinter (green), Sucrine (green) resistant: Capitan (green), Corsica (green), Multired 80 (red)
9.4	Test design	several mock-inoculated plants in the same tray
9.5	Test facility	climate chamber
9.6	Temperature	after inoculation 15-22°C
9.7	Light	12-16 h light ca. 5000 lux
10.	Inoculation	
10.1	Preparation inoculum	fresh leaf ground in fresh LMV buffer incl. carborundum and active charcoal
10.3	Plant stage at inoculation	1st leaf well-developed at 1st inoculation, optionally 4 days later 2nd inoculation
10.4	Inoculation method	rubbing, rinse carborundum off
10.7	Final observations	21 days post inoculation
11.	Observations	
11.1	Method	visual estimate of mosaic severity; compare with standards, preferably with standards of same growth type.
11.2	Observation scale	resistant = no symptoms susceptible = growth retardation, young leaves with mosaic, leaf curling

³ matref@geves.fr⁴ resistentie@naktuinbouw.nl

11.3	Validation of test	standards should conform to description
12.	Interpretation of data in terms of UPOV characteristic states	classify resistant or susceptible per plant, see 11.2.
13.	Critical control points	Sprinter is less susceptible than many other susceptible varieties, this variety can be used to detect low inoculation pressure in a specific experiment. anthocyanin coloration in leaves may mask mosaic symptoms and an earlier observation date for green varieties may be possible, depending on the reaction of the standard varieties in the test.

(ii) DNA marker test

The gene *mo1* (with its recessive alleles *mo1¹* or *mo1²*) gives resistance to LMV pathotype II. Alleles for resistance *mo1¹* and *mo1²* and the dominant allele for susceptibility *mo1⁰* can be detected by the co-dominant marker as described by V. Nicaise *et al.* (2003). Specific aspects:

1.	Pathogen	<i>Lettuce mosaic virus</i> pathotype II
2.	Functional gene	<i>mo1</i> (with two recessive alleles for resistance <i>mo1¹</i> and <i>mo1²</i> and one dominant allele for susceptibility <i>mo1⁰</i>)
3.	Probes and primers for Taqman PCR	
3.1.	Assay 1	to distinguish <i>mo1¹</i> genotypes from <i>mo1⁰</i> and <i>mo1²</i> genotypes (6 base deletion at nucleotide position 344-349):

Probe	DNA sequence '5-'3	Fluorophore color (optional)
Pr-del-mo1	GGCTCAAGGAGCTGACTTCTATTG	Texas Red (Susceptible)
Pr-del-mo1 ¹	GGCTCATGACTTCTATTG	6FAM-MGB (Resistant <i>mo1¹</i>)

Primers	DNA sequence '5-'3
Fw-del-mo1	CAACAACATACATCGACCAAGCAAGTTGGCTAAGGAGCTGACTTCTATTGTTCAAGAA
Rev-del-mo1	TTCCCCACTTAGGCTCGAT

Sequence amplicon: '5-'3

The amplicon sequence of the *mo1⁰* and *mo1²* allele:

TTACAACAAACATACATCGACCAAGCAAGTTGGCTAAGGAGCTGACTTCTATTGTTCAAGAA
TAAAATCGAGCCTAACGTGGGAAGACC

The amplicon sequence of the allele for resistance *mo1¹*:

TTACAACAAACATACATCGACCAAGCAAGTTGGCTCATGACTTCTATTGTTCAAGAATAAAATC
GAGCCTAACGTGGGAAGACC

3.2.	Assay 2	to distinguish <i>mo1²</i> genotypes from <i>mo1⁰</i> and <i>mo1¹</i> genotypes (SNP at nucleotide position 228):																				
Probe	DNA sequence '5-'3	Fluorophore color (optional)																				
Pr-SNP228- <i>mo1</i>	CTCCCTCT G CTAAGTC	6FAM-MGB (Susceptible)																				
Pr-SNP228- <i>mo1²</i>	ACTCCCTCT C CTAAGT	VIC-MGB (Resistant <i>mo1²</i>)																				
Primers	DNA sequence '5-'3																					
Fw-SNP228- <i>mo1</i>	GCATCCGCTCGAGCATTCTGGACTTCTGGTTCGATACTCCCTCT G CTAAGTCCAAGCA																					
Rev-SNP228- <i>mo1</i>	CTACCCCCAAGCGACTTGCTT																					
Sequence amplicon: '5-'3																						
The amplicon sequence of the <i>mo1⁰</i> and the <i>mo1¹</i> allele:																						
TCAGCATCCGCTCGAGCATTCTGGACTTCTGGTTCGATACTCCCTCT G CTAAGTCCAAGCA AGTCGCTTGGGGTAGTTCCATGCGCC																						
The amplicon sequence of the allele for resistance <i>mo1²</i> :																						
TCAGCATCCGCTCGAGCATTCTGGACTTCTGGTTCGATACTCCCTCT C CTAAGTCCAAGCA AGTCGCTTGGGGTAGTTCCATGCGCC																						
4.	Format of the test																					
4.1	Number of plants per genotype	at least 20 plants																				
4.2	Control varieties	Homozygous allele for susceptibility <i>mo1⁰</i> present: Sprinter, Sucrine Homozygous allele for resistance <i>mo1¹</i> present: Capitan, Kanaryole Homozygous allele for resistance <i>mo1²</i> present: Corianas Mix DNA to have heterozygous controls																				
5.	Preparation																					
5.1	Preparation DNA	Harvest per individual plant a part of a young leaf. Isolate total DNA with a standard DNA isolation protocol.																				
5.2	Preparation PCR	Pipette each DNA sample and a commercial real-time PCR mastermix into individual wells for assay 1 and for assay 2. Analyse the samples in a real-time PCR machine capable of reading the fluorophores of all the probes, with reaction conditions suitable for the mastermix used.																				
6.	PCR conditions	(detailed test protocol available through Naktuinbouw ⁵ (NL))																				
Assay 1:		<table border="1"> <thead> <tr> <th></th> <th>Temperature</th> <th>Time</th> <th>Ramping speed</th> </tr> </thead> <tbody> <tr> <td>Initial activation of enzyme</td> <td>95°C</td> <td>2' 00"</td> <td></td> </tr> <tr> <td>40 cycles</td> <td>95°C</td> <td>0' 15"</td> <td>5°C/sec</td> </tr> <tr> <td></td> <td>65°C</td> <td>0' 48"</td> <td>5°C/sec</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>		Temperature	Time	Ramping speed	Initial activation of enzyme	95°C	2' 00"		40 cycles	95°C	0' 15"	5°C/sec		65°C	0' 48"	5°C/sec				
	Temperature	Time	Ramping speed																			
Initial activation of enzyme	95°C	2' 00"																				
40 cycles	95°C	0' 15"	5°C/sec																			
	65°C	0' 48"	5°C/sec																			
Assay 2:		<table border="1"> <thead> <tr> <th></th> <th>Temperature</th> <th>Time</th> <th>Ramping speed</th> </tr> </thead> <tbody> <tr> <td></td> <td>95°C</td> <td>2' 00"</td> <td></td> </tr> <tr> <td>40 cycles</td> <td>95°C</td> <td>0' 15"</td> <td>5°C/sec</td> </tr> <tr> <td></td> <td>60°C</td> <td>0' 48"</td> <td>5°C/sec</td> </tr> <tr> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>		Temperature	Time	Ramping speed		95°C	2' 00"		40 cycles	95°C	0' 15"	5°C/sec		60°C	0' 48"	5°C/sec				
	Temperature	Time	Ramping speed																			
	95°C	2' 00"																				
40 cycles	95°C	0' 15"	5°C/sec																			
	60°C	0' 48"	5°C/sec																			
Analysis at end point RFU.																						

⁵ Naktuinbouw: resistantie@naktuinbouw.nl

7.	Observations	
7.1	Observations scale	

Assay 1:

Signal giving Fluorophore		
FAM ($mo1^1$)	Texas Red ($mo1^0$ or $mo1^2$)	
-	X	Homozygous $mo1^0$ or $mo1^2$, or heterozygous $mo1^0mo1^2$
X	-	Homozygous $mo1^1$
X	X	Heterozygous $mo1^0mo1^1$ or $mo1^1mo1^2$
-	-	No result, repeat test

Assay 2:

Signal giving Fluorophore		
FAM ($mo1^0$ or $mo1^1$)	VIC ($mo1^2$)	
(x) (FAM RFU << VIC RFU)	X	Homozygous $mo1^2$
X	-	Homozygous $mo1^0$ or $mo1^1$, or heterozygous $mo1^0mo1^1$
X	(x) (FAM RFU >> VIC RFU)	Heterozygous $mo1^0mo1^2$ or $mo1^1mo1^2$
-	-	No result, repeat test

7.2	Validation of the test	Control varieties should give the expected results.
8.	Interpretation of data in terms of UPOV characteristic states	The combination of the two PCR assays leads to the following predicted result in a bio-assay with LMV pathotype II:

Assay 2 ($mo1^2$)				
Assay 1 ($mo1^1$)	absent	present homozygous	heterozygous	
	absent	susceptible ($mo1^0$)	resistant ($mo1^2$)	susceptible ($mo1^0/mo1^2$)
	present homozygous	resistant ($mo1^1$)	-	-
	heterozygous	susceptible ($mo1^0/mo1^1$)	-	not yet validated

		<p>Heterozygous plants ($mo1^0mo1^1$ or $mo1^0mo1^2$) are predicted to be susceptible in the bio-assay, as $mo1^1$ and $mo1^2$ are recessive alleles. Heterozygous plants $mo1^1mo1^2$ need a conclusion from a bio-assay. Varieties showing a mixture of genotypes (heterozygous plants $mo1^0mo1^1$, $mo1^0mo1^2$ or homozygous $mo1^0$ plants (susceptible predicted phenotype) and homozygous $mo1^1$ or $mo1^2$ plants (resistant predicted phenotype)) are predicted to be non-uniform in the bio-assay.</p> <p>In case the DNA marker test result does not confirm the declaration in the TQ, a bio-assay should be performed to observe whether the variety is resistant due to another mechanism.</p>
--	--	--

Ad. 45: Resistance to *Nasonovia ribisnigri* (Nr) Biotype Nr: 0

1. Pathogen	<i>Nasonovia ribisnigri</i>
2. Quarantine status	no
3. Host species	lettuce - <i>Lactuca sativa</i> L.
4. Source of inoculum	Naktuinbouw ⁶ (NL)
5. Isolate	Nr: 0, preferably red colored biotype
6. Establishment isolate identity	the ends of the legs are black, size 1.5-2.5 mm
7. Establishment pathogenicity	with susceptible control Abel or Green Towers
8. Multiplication inoculum	
8.2 Multiplication variety	Abel or Green Towers
8.3 Plant stage at inoculation	4 to 6 leaves
8.5 Inoculation method	transfer ~5 aphids per plant
8.6 Harvest of inoculum	transfer to Petri-dish; shake off when aphids are numerous carefully remove aphids using a fine painting brush when only few are available check the black ends of the aphids legs a few hours in shadow
8.7 Check of harvested inoculum	
8.8 Shelf life/viability inoculum	
9. Format of the test	
9.1 number of plants per genotype	at least 20
9.2 number of replicates	no
9.3 Control varieties	susceptible: Abel, Green Towers, Nadine resistant: Barcelona, Bedford, Dynamite, Silvinas
9.4 Test design	
9.5 Test facility	glasshouse
9.6 Temperature	after inoculation: 20-22°C, keep below 26°C
9.7 Light	daylight
9.9 Special measures	containment of winged aphids needs special attention
10. Inoculation	
10.1 Preparation inoculum	transfer by shake-off or with brush into Petri-dish
10.3 Plant stage at inoculation	2 to 3 week old seedlings
10.4 Inoculation method	transfer 5 small or medium sized aphids to each plant
10.7 Final observations	15 to 20 days post inoculation
11. Observations	
11.1 Method	count red aphids per plant; if many aphids are present, strong growth reduction can be observed; for this observation, a separate aphid free tent is necessary for blanks
11.2 Observation scale	0 no aphids 1 1-5 aphids 2 6-10 aphids 3 >10 aphids
11.3 Validation of test	controls should be >95% ok; if >5% plants are in class 2 or off-type, the experiment should be repeated
12. Interpretation of data in terms of UPOV characteristic states	0 or 1 resistant 3 susceptible
13. Critical control points	allow sufficient time for the aphids born after inoculation to mature and turn red; as soon as this is the case, the test must be concluded; this may be before 15 days post inoculation. only adult, red aphids are counted; young aphids are transparent and do not count

⁶ resistantie@naktuinbouw.nl

Ad. 46: Resistance to *Fusarium oxysporum* f.sp. *lactucae* (Fol) Race 1

1. Pathogen	<i>Fusarium oxysporum</i> f.sp. <i>lactucae</i>
2. Quarantine status	EPPO alert list
3. Host species	lettuce - <i>Lactuca sativa</i> L.
4. Source of inoculum	NIAS Genebank ⁷ (JP), CREA-SCS ⁸ (IT), Naktuinbouw ⁹ (NL), GEVES ¹⁰ (FR)
5. Isolate	Fol: 1
6. Establishment isolate identity	use microscope and inoculation to lettuce susceptible standard
7. Establishment pathogenicity	use lettuce susceptible standard
8. Multiplication inoculum	
8.1 Multiplication medium	inoculation by sowing on contaminated soil: Wheat bran-soil medium inoculation by soaking seedlings: on synthetic liquid medium (e.g. Potatoes Dextrose Broth)
8.6 Harvest of inoculum	inoculation by sowing on contaminated soil: 7-10 day-old culture inoculation by soaking seedlings: 15 days
9. Format of the test	
9.1 Number of plants per genotype	at least 30, in case of doubt 60
9.2 Number of replicates	at least 2
9.3 Control varieties	absent or low resistance: Cobham Green, Patriot (Cobham Green is slightly less susceptible than Patriot) medium resistance: Affic, Fuzila, Natexitis (Natexitis is the lower level of medium resistance) high resistance: Costa Rica No.4, Romasol include control varieties
9.4 Test design	greenhouse or climate room
9.5 Test facility	25-28 °C (day) / 20 °C (night)
9.6 Temperature	under natural day length
9.7 Light	two methods can be used for inoculation:
10. Inoculation	
10.1 Preparation inoculum	
10.2 Quantification inoculum	
10.3 Plant stage at inoculation	
10.4 Inoculation method	two methods can be used, as described above
10.5 First observation	7- 10 days post inoculation
10.6 Second observation	14 days post inoculation
10.7 Final observations	20-25 days post inoculation (sowing or soaking). One or two of these 3 observations may be sufficient. The observation for inoculation by soaking is destructive since stems are cut for the observation of vessels.

⁷ genebank@nias.affrc.go.jp⁸ scs.sa@crea.gov.it⁹ resistantie@naktuinbouw.nl¹⁰ matref@geves.fr

11. Observations

11.1 Method

visual and/or counting number of plants with symptom; as information calculate a disease index.

11.2 Observation scale

inoculation by sowing seeds on contaminated soil	inoculation by soaking seedlings
Class 0: healthy	Class 0: plant without symptoms and healthy vessels 
Class 1: slightly stunting, growing reduction	Class 1: plant with brown vessels only below the cotyledon without yellowing and wilting 
Class 2: severely stunting	Class 2: plant with brown vessels above the cotyledon, without yellowing and wilting 
Class 3: dead plant	Class 3: plant yellowing and wilting, brown vessels 
	Class 4: dead plant 

11.3 Validation of test

Validation based on control varieties.

Expected behavior of control varieties:

Absent or low resistance: most plants in classes 3 and 4, few plants observed in classes 2 and 1

Medium resistance: most plants in classes 1, 2 and 3

High resistance: most plants in classes 0 and 1, few plants in class 2

12. Interpretation of data in terms of UPOV characteristic states

Results should be compared with the results of the control varieties based on distribution of plants over the classes.

For varieties close to medium resistance borders, an additional statistical analysis can be used to finalize the assessment of uniformity, and relative position regarding the results of control varieties.

inoculation by soaking seedlings

Class 0: plant without symptoms and healthy vessels

Class 1: plant with brown vessels only below the cotyledon without yellowing and wilting

Class 2: plant with brown vessels above the cotyledon, without yellowing and wilting

Class 3: plant yellowing and wilting, brown vessels

Class 4: dead plant

**11.3 Validation of test**

Validation based on control varieties.

Expected behavior of control varieties:

Absent or low resistance: most plants in classes 3 and 4, few plants observed in classes 2 and 1

Medium resistance: most plants in classes 1, 2 and 3

High resistance: most plants in classes 0 and 1, few plants in class 2

12. Interpretation of data in terms of UPOV characteristic states

Results should be compared with the results of the control varieties based on distribution of plants over the classes.

For varieties close to medium resistance borders, an additional statistical analysis can be used to finalize the assessment of uniformity, and relative position regarding the results of control varieties.

8.3 Lettuce types

See also 5.3 for a table to determine the type using several characteristics.

Butterhead type

Heading; thin to rather thick, tender leaves with a clear midrib; leaf shape circular to transverse broad elliptic; in general no incised margin; head shape ranging from broad elliptic to transvers elliptic.

Novita type

Cross between Butterhead and Iceberg type for glasshouse growing. Open heading; leaf structure like Butterhead, incisions of the margin as Iceberg.

Iceberg type

Heading with strong or very strong overlapping of upper part of leaves; thick and crispy leaves, predominantly green and greyish green, leaf margin hardly to rather strongly incised, no clear midrib but with flabellate venation.

Batavia type

Open to strong heading; generally medium thick, rather strongly blistered leaves, predominantly yellowish or medium green; leaf margin with weak to strong undulation.

Frisée d'Amérique type

Lollo type

Oakleaf type

Multi-divided type

Non-heading, loose, generally quite large plant; thin leaves. Compared to Lollo type in general less undulating margin and showing more leaf blade. Compared to Batavia type, leaves are thinner. Mainly used for babyleaf production.

Non-heading; thin leaves with strongly undulated leaf margin. The plant as a whole shows mainly the undulating leaf margins. In general strongly blistered leaves, blisters are rather small.

Thin, divided leaves; divisions have an oakleaf or lobed shape with in general a rounded tip. Radicchetta or Catalogna with acute tip of the division. Heart can be loose to dense.

Non-heading; thin, medium to very strong divided leaves. Tip of divisions can be undulated and incised. Plant may look as a Lollo type, but leaves are always divided.

Frillice type

Non-heading; thick, crispy leaves, sometimes weakly divided. Clearly incised leaf margin.

Cos type

Elongated and rather tough leaves with a clear midrib, head shape in longitudinal section elliptic, length of head $>1.5 \times$ diameter; heading can be very late.

Gem type

Tough leaves with clear midrib, head shape short elliptic to slightly obovate. Some types only have a tightly filled heart, others are more similar to a short Cos type. Suitable for semi-arid conditions.

Stem type

Forms a fleshy stem before bolting, at least under (semi-)short day conditions; leaves are mainly tough and have a clear midrib. Leaves and/or stem are consumed.

10. Technical Questionnaire

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
		Application date: (not to be filled in by the applicant)
TECHNICAL QUESTIONNAIRE to be completed in connection with an application for plant breeders' rights		
1. Subject of the Technical Questionnaire		
1.1	Botanical name	<i>Lactuca sativa L.</i>
1.2	Common name	Lettuce
2. Applicant		
Name		
Address		
Telephone No.		
Fax No.		
E-mail address		
Breeder (if different from applicant)		
3. Proposed denomination and breeder's reference		
Proposed denomination (if available)		
Breeder's reference		

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

#4. Information on the breeding scheme and propagation of the variety

4.1 Breeding scheme

Variety resulting from:

4.1.1 Crossing

- (a) controlled cross []
(b) partially known cross []
(c) unknown cross []

4.1.2 Mutation

(please state parent variety)

4.1.3 Discovery and development []

(please state where and when discovered and how developed)

4.1.4 Other []

(please provide details)

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

4.2 Method of propagating the variety

4.2.1 Seed-propagated varieties

(a) Self-pollination

[]

(b) Other (please provide details)

[]

4.2.2 Other

(Please provide details)

[]

6. Similar varieties and differences from these varieties

Please use the following table and box for comments to provide information on how your candidate variety differs from the variety (or varieties) which, to the best of your knowledge, is (or are) most similar. This information may help the examination authority to conduct its examination of distinctness in a more efficient way.

Denomination(s) of variety(ies) similar to your candidate variety	Characteristic(s) in which your candidate variety differs from the similar variety(ies)	Describe the expression of the characteristic(s) for the similar variety(ies)	Describe the expression of the characteristic(s) for your candidate variety
<i>Example</i>	<i>Plant: diameter</i>	<i>medium</i>	<i>medium to large</i>

TECHNICAL QUESTIONNAIRE

Page {x} of {y}

Reference Number:

8. Authorization for release

- (a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes [] No []

- (b) Has such authorization been obtained?

Yes [] No []

If the answer to (b) is yes, please attach a copy of the authorization.

9. Information on plant material to be examined or submitted for examination

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes [] | No [] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [] | No [] |
| (c) Tissue culture | Yes [] | No [] |
| (d) Other factors | Yes [] | No [] |

Please provide details for where you have indicated "yes".

.....

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:
