\* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website ([www.upov.int](http://www.upov.int)), for the latest information.]

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

### **ASSOCIATED DOCUMENTS**

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

## 1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Solanum lycopersicum* L. x, *Solanum habrochaites* S. Knapp & D.M. Spooner (*Lycopersicum esculentum* Mill. x *Lycopersicum hirsutum* Dunal.), *Solanum lycopersicum* x *Solanum peruvianum* and *Solanum lycopersicum* x *Solanum chesmanii*. Such varieties are generally used as rootstocks for tomato varieties (varieties of *Solanum lycopersicum* L (*Lycopersicum esculentum* Mill.)). Rootstocks belonging to *Solanum lycopersicum* L (*Lycopersicum esculentum* Mill.) or to *Solanum lycopersicum* L x *Solanum pimpinellifolia* L. (*Lycopersicum esculentum* Mill. x *Lycopersicum pimpinellifolia* Mill.) should be covered by UPOV Test Guidelines TG/44/10.

## 2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed or plants.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

- a) seed-propagated varieties: 10g or 2500 seeds
- b) vegetatively propagated varieties: 25 plants plus the number required for disease resistance tests.

In the case of seed, the seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. For disease resistance testing, additional plant material may be requested.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

## 3. Method of Examination

### 3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

### 3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

### 3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

### 3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 20 plants, which should be divided between at least two replicates.

3.4.2 When resistance characteristics are used for assessing distinctness, uniformity and stability, records must be taken under conditions of controlled infection and, unless otherwise specified, on at least 20 plants.

3.4.3 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

### 3.5 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

## 4. Assessment of Distinctness, Uniformity and Stability

### 4.1 *Distinctness*

#### 4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

#### 4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

#### 4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

#### 4.1.4 Number of Plants / Parts of Plants to be Examined

Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 10 plants or parts taken from each of 10 plants and any other observations made on all plants in the test disregarding any off-type plants.

#### 4.1.5 Method of Observation

The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the second column of the Table of Characteristics (see document TGP/9 “Examining Distinctness”, Section 4 “Observation of characteristics”):

MG: single measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by a single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)

“Visual” observation (V) is an observation made on the basis of the expert’s judgment. For the purposes of this document, “visual” observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. color charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)

For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, “G” provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.”

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

## 4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 The assessment of uniformity should be according to the recommendations for cross-pollinated varieties in the General Introduction.

### 4.3 Stability

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be further examined by testing a new seed or plant stock to ensure that it exhibits the same characteristics as those shown by the initial material supplied.

## 5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Fruit: green shoulder (before maturity) (characteristic 15)
- (b) Sensitivity to autonecrosis (characteristic 21)
- (c) Resistance to *Meloidogyne incognita* (characteristic 22)
- (d) Resistance to *Verticillium* sp. – Race 0 (characteristic 23)
- (e) Resistance to *Fusarium oxysporum* f. sp. *lycopersici* – Race 0 (ex 1) (characteristic 24.1)
- (f) Resistance to *Fusarium oxysporum* f. sp. *lycopersici* – Race 1 (ex 2) (characteristic 24.2)
- (g) Resistance to *Fusarium oxysporum* f. sp. *lycopersici* – Race 2 (ex 3) (characteristic 24.3)
- (h) Resistance to *Pyrenochaeta lycopersici* (characteristic 28)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction and document TGP/9 “Examining Distinctness”.

## 6. Introduction to the Table of Characteristics

### 6.1 *Categories of Characteristics*

#### 6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

#### 6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by \*) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

### 6.2 *States of Expression and Corresponding Notes*

6.2.1 States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.2.2 In the case of qualitative and pseudo-qualitative characteristics (see Chapter 6.3), all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

| State  | Note |
|--------|------|
| small  | 3    |
| medium | 5    |
| large  | 7    |

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

| State               | Note |
|---------------------|------|
| very small          | 1    |
| very small to small | 2    |
| small               | 3    |
| small to medium     | 4    |
| medium              | 5    |
| medium to large     | 6    |
| large               | 7    |
| large to very large | 8    |
| very large          | 9    |

6.2.3 Further explanation of the presentation of states of expression and notes is provided in document TGP/7 "Development of Test Guidelines".

### 6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

### 6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

### 6.5 *Legend*

(\*) Asterisked characteristic – see Chapter 6.1.2

QL Qualitative characteristic – see Chapter 6.3

QN Quantitative characteristic – see Chapter 6.3

PQ Pseudo-qualitative characteristic – see Chapter 6.3

MG, MS, VG, VS – see Chapter 4.1.5

(a)-(c) See Explanations on the Table of Characteristics in Chapter 8.1

## 8. Explanations on the Table of Characteristics

### 8.1 *Explanations covering several characteristics*

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) All observations on the plant, stem and leaves should be done after a fruit set on at least five trusses and before ripening of the second truss. Observations should be done before deterioration of the leaves.
- (b) All observations on the fruit should be made on mature fruits from the second or higher truss.
- (c) All observations on the green shoulder of the fruit should be made on the plant before maturity.

### 8.2 *Explanations for individual characteristics*

#### Ad. 1: Seedling: anthocyanin coloration of hypocotyl

#### Ad. 2: Plant: height

To be observed after a fruit set on 5 nodes

Ad. 3: Stem: anthocyanin coloration of upper third

Most of the varieties are classed 1 to 5. Expression of anthocyanin is influenced by day temperature. Under greenhouse conditions, the variation is rather low, except for varieties with Tm2 allele which is linked to anthocyanin of the stem (especially at the internode).

3  
weak

5  
medium

7  
strong

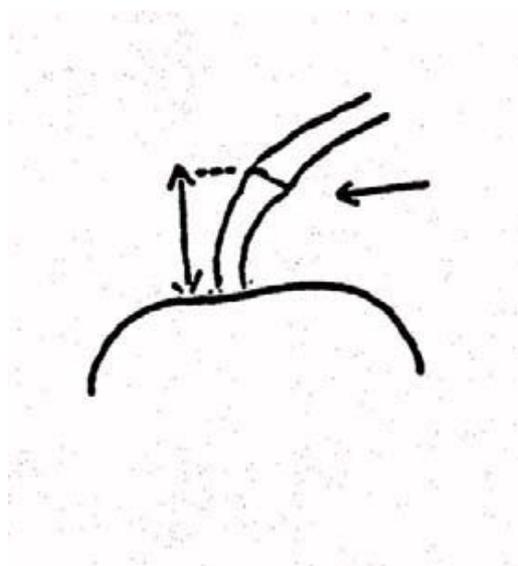

Ad. 4: Stem: length of internode (between 1<sup>st</sup> and 4<sup>th</sup> inflorescence)

The length of the internode should be observed/measured at one time for the whole trial, e.g after a fruit set on approximately 5 nodes. The total length of the stem should be observed/measured between the 1<sup>st</sup> and 4<sup>th</sup> trusses. When this observation/measure is divided by the number of internodes in between, an indication of the length of the internode is given.

Ad. 7: Leaf: size of leaflets (in middle of leaf)

The size of the leaflet should be observed in the middle of the leave.

Ad. 11: Pedicel: length (from abscission layer to calyx)

Ad. 13: Fruit: shape in longitudinal section

1  
flattened

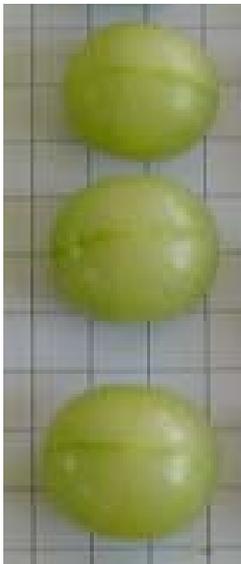

2  
slightly flattened

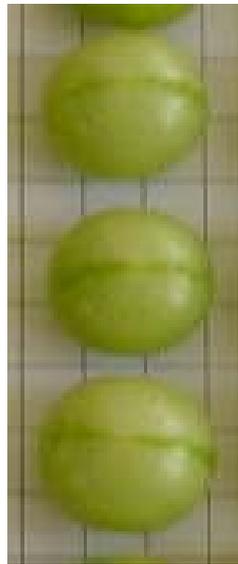

3  
circular

Ad. 18 Fruit: conspicuousness of meridian stripes (before maturity)

3  
weak

5  
medium

7  
strong

Ad. 21: Sensitivity to autonecrosis

Method:

Evaluation:

evaluation is done on fully-grown plants

Execution of test:

autonecrosis can be observed under normal growing conditions.

Sowing:

normal trial conditions

Temperature:

normal trial temperatures

Light: normal daylight

Growing method: no special method necessary

Duration of test: 4 - 5 months

Number of plants tested: minimum of 20

Observation of the expression: A visual survey has to be made on the presence of leaves that show signs of autonecrosis

Standard varieties:

|                       |          |
|-----------------------|----------|
| insensitive:          | Maxifort |
| moderately sensitive: | Beaufort |
| very sensitive:       | Body     |

#### Ad. 22: Resistance to *Meloidogyne incognita* (Mi)

1. Pathogen *Meloidogyne incognita*
3. Host species ..... *Solanum lycopersicum*
4. Source of inoculum ..... Naktuinbouw<sup>1</sup> (NL) or GEVES<sup>2</sup> (F)
5. Isolate ..... non-resistance breaking
6. Establishment isolate identity .... use rootstock or tomato standards
7. Establishment pathogenicity ..... use susceptible rootstock or tomato standard
8. Multiplication inoculum
  - 8.1 Multiplication medium ..... living plant
  - 8.2 Multiplication variety ..... Delito (resistant to powdery mildew)
  - 8.3 Plant stage at inoculation..... 10.3
  - 8.5 Inoculation method..... 10.4
  - 8.6 Harvest of inoculum ..... root systems are cut with scissors into pieces  
..... of about 1 cm length
  - 8.7 Check of harvested inoculum... visual check for presence of root knots
  - 8.8 Shelf life/viability inoculum..... 1 day
9. Format of the test
  - 9.1 Number of plants per genotype 20 plants
  - 9.3 Control varieties  
Absent (Susceptible): ..... Bruce and (*Solanum lycopersicum*) Clairvil, Casaque Rouge  
Intermediate :..... (*Solanum lycopersicum*) Madyta, “Anahu x Monalbo”  
Present (Resistant): ..... Emperador and (*Solanum lycopersicum*) Anabel, Anahu
  - 9.4 Test design ..... include standard varieties
  - 9.5 Test facility ..... greenhouse or climate room
  - 9.6 Temperature ..... not over 28° C
  - 9.7 Light ..... at least 12 h per day
10. Inoculation
  - 10.1 Preparation inoculum ..... small pieces of diseased root mixed with soil

<sup>1</sup> Naktuinbouw; resistentie@naktuinbouw.nl

<sup>2</sup> GEVES; Valerie.GRIMAULT@geves.fr

- ..... mix soil and infested root pieces
- 10.2 Quantification inoculum..... soil: root ratio = 8:1
- 10.3 Plant stage at inoculation ..... seed
- 10.4 Inoculation method ..... plants are sown in infested soil
- 10.7 End of test ..... 28 to 45 days after inoculation
11. Observations
- 11.1 Method ..... root inspection
- 11.2 Observation scale ..... Symptoms:  
..... Galling, root malformation,  
..... growth reduction, plant death  
..... 1-10 galls per root system may be counted
- 11.3 Validation of test ..... on standards
- 11.4 Off-types..... resistant varieties may have a few plants with a few galls
12. Interpretation of data in terms of UPOV characteristic states  
[1] Absent; growth strongly reduced, high gall count  
[2] Intermediate; medium growth reduction, medium gall count  
[3] Present; no growth reduction, no galls
13. Critical control points:  
Avoid rotting of roots; high temperature causes breakdown of resistance

#### Literature references

Laterrot, H., 1973: Sélection de variétés de Tomate résistantes aux Meloidogyne, OEPP/EPPO Bulletin 3(1): 89.92.

#### Ad. 23: Resistance to *Verticillium* sp.

1. Pathogen ..... *Verticillium dahliae* or *Verticillium albo-atrum* (see note below)
3. Host species..... *Solanum lycopersicum*
4. Source of inoculum ..... Naktuinbouw<sup>3</sup>(NL) and GEVES<sup>4</sup> (F)
5. Isolate ..... Race 0
8. Multiplication inoculum
- 8.1 Multiplication medium..... Potato Dextrose Agar, Medium “S” of Messiaen
- 8.4 Inoculation medium..... Czapek Dox broth, 20-25°C, in darkness
- 8.6 Harvest of inoculum ..... 3-7 d-old aerated culture  
..... filter through double muslin cloth
- 8.7 Check of harvested inoculum... spore count; adjust to 10<sup>6</sup> per ml
- 8.8 Shelf life/viability inoculum..... 1 d at 4°C
9. Format of the test
- 9.1 Number of plants per genotype 35 seed for 24 plants
- 9.3 Control varieties
- Susceptible ..... (*Solanum lycopersicum*) Marmande, Flix, Planet
- Resistant ..... Big Power and (*Solanum lycopersicum*) Monalbo, Elias
- 9.4 Test design..... 22 plants inoculated, 2 blanks

<sup>3</sup> Naktuinbouw; resistentie@naktuinbouw.nl

<sup>4</sup> GEVES; Valerie.GRIMAULT@geves.fr

- 9.5 Test facility..... greenhouse or climate room  
9.6 Temperature ..... 25°C for germination, 20-22°C after inoculation  
9.7 Light ..... 16 h or longer  
10. Inoculation  
10.1 Preparation inoculum ..... aerated, liquid culture (8.4)  
10.2 Quantification inoculum..... count spores, adjust to 10<sup>6</sup> per ml  
10.3 Plant stage at inoculation..... cotyledon to 3rd leaf  
10.4 Inoculation method..... roots are immersed for 4 to 15 min in spore suspension.  
10.5 First observation ..... 14 d after inoculation  
10.6 Second observation ..... 21 d after inoculation  
10.7 End of test..... 21-33 d after inoculation  
11. Observations  
11.1 Method ..... visual  
11.2 Observation scale ..... growth retardation, wilting, chlorosis, and vessel  
browning  
11.3 Validation of test ..... compare  
12. Interpretation of data in terms of UPOV characteristic states  
[1] severe symptoms  
[9] no or mild symptoms

### 13. Critical control points

All symptoms may be present in resistant varieties, but the severity will be distinctly less than in susceptible varieties. Usually resistant varieties will show significantly less growth retardation than susceptible varieties. Observation of vessel browning is important for diagnosis. Usually, vessel browning will not extend to the 1st leaf in resistant varieties. Many hybrid varieties are heterozygous and appear to have a relatively weak resistance in the biotest.

**Note:** Resistance to *V. dahliae* based in the *Ve* gene is also effective to *V. albo-atrum*. Isolates of both fungal species may be used to evaluate the UPOV characteristic “Resistance to *V. dahliae*” or *V. albo-atrum* as long as the isolate belongs to the non-*Ve* breaking race 0. Resistance-breaking isolates have been described in both species.

Literature references Denby, L. G., Wooliams, G. E., 1962: The Development of Verticillium Resistant Strains of Established Tomato Varieties, Canadian Journal Plant Science 42,681-685.

Ad. 24: Resistance to *Fusarium oxysporum* f. sp. *lycopersici* (Fol)

|  |   |
|--|---|
| 1. Pathogen  | <i>Fusarium oxysporum</i> f. sp. <i>lycopersici</i>                               |

<sup>6</sup> GEVES; Valerie.GRIMAULT@geves.fr

- 10.3 Plant stage at inoculation..... 10-18 d, cotyledon to first leaf  
 10.4 Inoculation method..... roots and hypocotyls are immersed in spore suspension  
 ..... for 5-15 min; trimming of roots is an option  
 10.5 First observation..... 14 days after inoculation  
 10.7 End of test..... 21 days after inoculation  
 11. Observations  
 11.1 Method ..... visual  
 11.2 Observation scale ..... Symptoms:  
 ..... growth retardation, wilting, yellowing,  
 ..... vessel browning extending above cotyledon  
 11.3 Validation of test ..... on standards  
 12. Interpretation of data in terms of UPOV characteristic states  
 [1] severe symptoms  
 [9] mild or no symptoms

### 13. Critical control points

Test results may vary slightly in inoculum pressure due to differences in isolate, spore concentration, soil humidity and temperature. Standards near borderline R/S are essential to compare between labs.

### Literature references

Laterrot, H., 1972: Sélection de tomates résistantes à *Fusarium oxysporum* f. sp. *lycopersici*, *Phytopathologia Mediterranea*, Volume XI, No. 3, p. 154-158.

### Ad. 25: Resistance to *Fusarium oxysporum* f. sp. *radicis-lycopersici* (For)

1. Pathogen *Fusarium oxysporum* f. sp. *radicis-lycopersici*  
 3. Host species..... *Solanum lycopersicum*  
 4. Source of inoculum ..... Naktuinbouw<sup>7</sup> (NL) and GEVES<sup>8</sup> (F)  
 5. Isolate ..... -  
 7. Establishment pathogenicity ..... symptoms on susceptible tomato  
 Multiplication inoculum  
 8.1 Multiplication medium..... Potato Dextrose Agar, Medium “S” of Messiaen  
 8.4 Inoculation medium..... Czapek-Dox culture  
 8.5 Inoculation method..... immersion of roots in spore suspension, 5-15 min  
 8.6 Harvest of inoculum ..... 7 d-old aerated culture  
 ..... filter through double muslin cloth  
 8.7 Check of harvested inoculum... spore count; adjust to 10<sup>6</sup> per ml  
 8.8 Shelf life/viability inoculum.... 4-8 h, keep cool to prevent spore germination  
 9. Format of the test  
 9.1 Number of plants per genotype at least 20  
 9.3 Control varieties  
 Susceptible: ..... Kemerit and (*Solanum lycopersicum*) Motelle,  
 ..... Moneymaker  
 Resistant: ..... Emperador and (*Solanum lycopersicum*) Momor,  
 ..... “Momor x Motelle”

<sup>7</sup> Naktuinbouw: resistentie@naktuinbouw.nl

<sup>8</sup> GEVES: Valerie.GRIMAULT@geves.fr

- Remark: ..... “Momor x Motelle” has slightly weaker resistance than Momor
- 9.4 Test design..... 35 seeds for 24 plants, including 2 blanks
- 9.5 Test facility..... glasshouse or climate room
- 9.6 Temperature ..... 24-28°C (severe test, with mild isolate)  
..... 20-24°C (mild test, with severe isolate)
- 9.7 Light ..... at least 16 hours per day
- 9.8 Season..... all seasons
- 9.9 Special measures ..... slightly acidic peat soil is optimal;  
..... keep soil humid but avoid water stress
10. Inoculation
- 10.1 Preparation inoculum ..... aerated culture 7-10 days
- 10.2 Quantification inoculum..... spore count, adjust to  $10^6$  spores per ml
- 10.3 Plant stage at inoculation..... 12-18 d, cotyledon to third leaf
- 10.4 Inoculation method..... roots and hypocotyls are immersed in spore suspension  
..... for 5 min; trimming of roots is an option
- 10.5 First observation..... 14 days after inoculation
- 10.7 End of test..... 14-21 days after inoculation
11. Observations
- 11.1 Method ..... visual; a few plants are lifted at the end of the test
- 11.2 Observation scale ..... Symptoms:  
..... Plant death  
..... Growth retardation caused by root degradation  
..... Root degradation
12. Interpretation of data in terms of UPOV characteristic states  
[1] symptoms  
[9] no symptoms
13. Critical control points  
Temperature should never exceed 27°C during the test period; frequent renewal of races may be needed because of loss of pathogenicity

Ad. 26: Resistance to *Fulvia fulva* (Ff) (ex *Cladosporium fulvum*)

|  |  |
|--|--|
| 1. Pathogen                            | <i>Fulvia fulva</i> (ex <i>Cladosporium fulvum</i> )   |

| 9.9 Special measures .....             | humidity tent closed 3 days after inoculation  |
| .....                                  | After this, 66% closed during day, until end   |
| 10. Inoculation                        |  |
| 10.1 Preparation inoculum .....        | prepare evenly colonized plates, 1 for 36 plants;<br>remove spores from plate by scraping 2-3 times with<br>1 ml |
| .....                                  | demi water with 0,01% Tween20;   |
| .....                                  | filter through double muslin cloth   |
| 10.2 Quantification inoculum.....      | count spores; adjust to 5.10 <sup>5</sup> spores per ml  |
| 10.3 Plant stage at inoculation.....   | 19-20 d (incl. 12 d at 24°), 2-3 leaves  |
| 10.4 Inoculation method.....           | spray on dry leaves  |
| 10.7 End of test.....                  | 14 days after inoculation  |
| 11. Observations                       |  |
| 11.1 Method .....                      | visual inspection of abaxial side of inoculated leaves   |
| 11.2 Observation scale .....           | Symptom: velvety, white spots  |

<sup>9</sup> Naktuinbouw: resistentie@naktuinbouw.nl

<sup>10</sup> GEVES: Valerie.GRIMAULT@geves.fr

- 11.3 Validation of test ..... on standard varieties  
11.4 Off-types..... excessively high humidity may cause  
..... rugged brown spots on all leaves  
12. Interpretation of data in terms of UPOV characteristic states  
[1] symptoms  
[9] no symptoms

13. Critical control points:

Ff spores have a variable size and morphology. Small spores are also viable.  
Fungal plates will gradually become sterile after 6-10 weeks. Store good culture at -80°C.  
For practical purposes, it is not possible to keep plants longer than 14 days inside a tent.

Ad. 27: Resistance to Tomato Mosaic Virus (ToMV)

1. Pathogen Tomato mosaic virus  
3. Host species..... *Lycopersicon esculentum*  
4. Source of inoculum ..... Naktuinbouw<sup>11</sup> (NL) or GEVES<sup>12</sup> (F)  
5. Isolate ..... Strain 0, 1 and 2  
6. Establishment isolate identity..... genetically defined tomato standards  
..... Mobaci (Tm1) , Moperou (Tm2), Momor (Tm2<sup>2</sup>)  
7. Establishment pathogenicity ..... on susceptible plant  
8. Multiplication inoculum  
8.1 Multiplication medium..... living plant  
8.2 Multiplication variety ..... Moneymaker, Marmande  
8.7 Check of harvested inoculum... on *Nicotiana tabacum* “Xanthi”, check lesions after 2 days  
8.8 Shelf life/viability inoculum..... fresh>1 day, desiccated>1year  
9. Format of the test  
9.1 Number of plants per genotype at least 20  
9.3 Control varieties  
Susceptible ..... (*Solanum lycopersicum*) Marmande, Monalbo  
Resistant for ToMV: 0 and 2..... (*Solanum lycopersicum*) Mobaci  
Resistant for ToMV: 0 and 1 ..... (*Solanum lycopersicum*) Moperou  
Resistant with necrosis ..... (*Solanum lycopersicum*) “Monalbo x Momor”  
Resistant ..... (*Solanum lycopersicum*) Gourmet  
9.4 Test design..... blank treatment with PBS and carborundum  
9.5 Test facility..... Glasshouse or climate room  
9.6 Temperature ..... 25°C day, 23°C night  
9.7 Light ..... 16 hours

<sup>11</sup> Naktuinbouw: resistentie@naktuinbouw.nl

<sup>12</sup> GEVES: Valerie.GRIMAULT@geves.fr

9.8 Season..... symptoms are more pronounced in summer

10. Inoculation

10.1 Preparation inoculum ..... 1 g leaf with symptoms with 10 ml PBS  
..... Homogenize, add carborundum to PBS (1 g/30ml)

10.3 Plant stage at inoculation..... 2 leaves

10.4 Inoculation method..... gentle rubbing with sponge wetted with inoculum

10.5 First observation..... 11 days after inoculation

10.7 End of test..... 19 days after inoculation

11. Observations

11.1 Method ..... visual

11.2 Observation scale ..... Symptoms of susceptibility:

..... Mosaic in top, Leaf malformation

..... Symptoms of resistance (based on hypersensitivity):

..... Local Necrosis, Top necrosis, Systemic Necrosis

Remark: in some varieties a variable proportion of plants may have severe systemic necrosis or some necrotic spots while the other plants have no symptoms. This proportion may vary between experiments

12. Interpretation of data in terms of UPOV characteristic states

[1] symptoms of susceptibility

[9] no symptoms, or symptoms of hypersensitive resistance

13. Critical control points:

Temperature and light may influence the development of necrosis. More light means more necrosis.

Resistant varieties may have symptomless plants and plants with severe necrosis; in spite of apparent segregation the sample may be evaluated as uniform for resistance

Remark ..... Strain INRA Avignon 6-5-1-1 is recommended. This Strain causes a striking yellow Aucuba mosaic

Laterrot, H. and Blancard, D., 1986: Les Stemphyliia rencontrés sur la Tomate, *Phytopath. medit.* 1986, 25, 140-144.

#### Ad. 30: Resistance to Tomato yellow leaf curl virus (TYLCV)

- 1. Pathogen Tomato yellow leaf curl virus (see note below)
- 2. Quarantine status ..... yes
- 3. Host species ..... *Solanum lycopersicum*
- 4. Source of inoculum ..... -
- 5. Isolate ..... -
- 8. Multiplication inoculum
- 8.6 Harvest of inoculum ..... symptomatic leaves may be stored at -70°C
- 9. Format of the test
- 9.1 Number of plants per genotype 20
- 9.3 Control varieties
- Susceptible: ..... local varieties
- Resistant: ..... (*Solanum lycopersicum*) TY 20, Anastasia, Mohawk
- 9.5 Test facility ..... field with natural disease pressure
- 9.9 Special measures ..... prevent spread of white-flies
- 10. Inoculation
- 10.3 Plant stage at inoculation ..... 6-12 weeks (adult plants)
- 10.4 Inoculation method ..... vector (Bemisia white-flies carrying TYLCV)
- 10.7 End of test ..... 1-2 months after inoculation
- 11. Observations
- 11.1 Method ..... visual
- 11.2 Observation scale ..... Symptoms: leaf yellowing and curling
- 11.3 Validation of test ..... on standard varieties
- 12. Interpretation of data in terms of UPOV characteristic states
  - [1] severe symptoms
  - [9] no or mild symptoms

13. Critical control points:

TYLCV is endemic in many tropical and subtropical areas and has a quarantine status in many countries with a temperate climate. TYLCV is on the EPPO alert list. Some TYLCV resistant varieties may be susceptible to the closely related virus Tomato yellow leaf curl Sardinia virus (TYLCSV).\

### Ad. 31: Resistance to Tomato spotted wilt virus (TSWV)

1. Pathogen Tomato spotted wilt virus (see note below)
2. Quarantine status ..... yes (see note below)
3. Host species ..... *Solanum lycopersicum*
4. Source of inoculum ..... Naktuinbouw<sup>13</sup> (NL)
5. Isolate ..... race 0, preferably a thrips-transmission deficient variant
7. Establishment pathogenicity ..... biotest
8. Multiplication inoculum
- 6 Harvest of inoculum ..... symptomatic leaves may be stored at -70°C
9. Format of the test
- 9.1 Number of plants per genotype 20
- 9.3 Control varieties
- Susceptible: ..... Big Power and (*Solanum lycopersicum*) Monalbo
- Resistant: ..... Enpower and (*Solanum lycopersicum*) Tsunami, Bodar,  
..... Lisboa
- 9.5 Test facility ..... glasshouse
- 9.6 Temperature ..... 20°C
- 9.7 Light ..... 16 hours
- 9.9 Special measures ..... prevent or combat thrips
10. Inoculation
- 10.1 Preparation inoculum ..... press symptomatic leaves in ice-cold buffer  
..... 0,01 M PBS, pH 7.4, with 0,01 M sodium sulfite  
..... sieve the leaf sap through double muslin
- 10.3 Plant stage at inoculation ..... one or two expanded leaves
- 10.4 Inoculation method ..... mechanical, rubbing with carborundum on cotyledons,  
inoculum suspension < 10° C
- 10.5 First observation ..... 7 days after inoculation
- 10.6 Second observation ..... 14 days after inoculation
- 10.7 End of test ..... 21 days after inoculation
11. Observations
- 11.1 Method ..... visual
- 11.2 Observation scale ..... Symptoms: top mosaic, bronzing, various malformations,  
necrosis
- 11.3 Validation of test ..... on standard varieties
12. Interpretation of data in terms of UPOV characteristic states  
[1] symptoms  
[9] no symptoms
13. Critical control points:

---

<sup>13</sup> Naktuinbouw: [resistentie@naktuinbouw.nl](mailto:resistentie@naktuinbouw.nl)

TSWV has a quarantine status in some countries. TSWV is transmitted by *Thrips tabaci* and Western flower thrips (*Frankliniella occidentalis*). Pathotype 0 is defined by its inability to break resistance in tomato varieties carrying the resistance gene Sw-5. TSWV resistance based on Sw-5 may be detected without using the pathogen.

| 8.4 Inoculation medium.....            | water   |
| 8.5 Inoculation method.....            | see 10.4  |
| 8.6 Harvest of inoculum .....          | by washing off  |
| 8.7 Check of harvested inoculum...     | check for contaminants under microscope               |
| 8.8 Shelf-life/viability inoculum .... | 1-2 hours   |
| 9. Format of the test                  |   |
| 9.1 Number of plants per genotype      | 20  |
| 9.3 Control varieties .....            |   |
| Susceptible: .....                     | ( <i>Solanum lycopersicum</i> ) Momor                 |
| Resistant tomato: .....                | Multifort and ( <i>Solanum lycopersicum</i> ) Atlanta |
| 9.5 Test facility.....                 | glasshouse  |
| 9.6 Temperature .....                  | 24°C during the day; 18°C during the night            |
| 9.7 Light .....                        | 12 hours  |
| 10. Inoculation                        |   |
| 10.1 Preparation inoculum .....        | collect spores in water                               |
| 10.2 Quantification inoculum.....      | 10 <sup>4</sup> conidia/ml                            |
| 10.3 Plant stage at inoculation.....   | 3 weeks   |
| 10.4 Inoculation method.....           | by spraying on leaves or dredging of leaves           |
| 10.5 First observation.....            | 7 days after inoculation                              |
| 10.6 Second observation .....          | 14 days after inoculation                             |
| 10.7 End of test.....                  | 18 days after inoculation                             |
| 11. Observations                       |   |
| 11.1 Method .....                      | visual  |

11.2 Observation scale ..... 0. no sporulation  
..... 1. necrotic points and sometimes locally restricted  
sporulation

..... 2. moderate sporulation  
..... 3. abundant sporulation

11.3 Validation of test ..... on standard varieties

12. Interpretation of data in terms of UPOV characteristic states

..... [1] Moderate or abundant sporulation

..... [9] No or restricted sporulation

13. Critical control points:

Resistance-breaking isolates should be avoided. Resistance to *O. neolycopersici* is usually race-specific. However, as long as a differential series of tomato genotypes with well defined resistances is lacking, it will remain hard to conclude that different races of *O. neolycopersici* exist.

6. Similar varieties and differences from these varieties

*Please use the following table and box for comments to provide information on how your candidate variety differs from the variety (or varieties) which, to the best of your knowledge, is (or are) most similar. This information may help the examination authority to conduct its examination of distinctness in a more efficient way.*

| Denomination(s) of variety(ies) similar to your candidate variety | Characteristic(s) in which your candidate variety differs from the similar variety(ies) | Describe the expression of the characteristic(s) for the <b>similar</b> variety(ies) | Describe the expression of the characteristic(s) for <b>your</b> candidate variety |
|---|---|--|--|
| He-Wolf   | Fruit: shape in longitudinal section  | slightly flattened   | circular   |
|   |   |  |  |
|   |   |  |  |
|   |   |  |  |

Comments:

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- |   |         |        |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma)    | Yes [ ] | No [ ] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [ ] | No [ ] |
| (c) Tissue culture  | Yes [ ] | No [ ] |
| (d) Other factors   | Yes [ ] | No [ ] |

Please provide details for where you have indicated “yes”.
