Latin	English	French	German	Spanish
<i>Mangifera indica L.</i>	Mango	Manguier	Mango	Mango

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

**ASSOCIATED DOCUMENTS**

These guidelines (“Test Guidelines”) should be read in conjunction with document TG/1/3, “General Introduction to the Examination of Distinctness, Uniformity and Stability and the Development of Harmonized Descriptions of New Varieties of Plants” (hereinafter referred to as the “General Introduction”) and its associated “TGP” documents.

\* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website ([www.upov.int](http://www.upov.int)), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Mangifera indica* L.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of budsticks.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

12 budsticks, sufficient to propagate 5 trees.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment, which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

The growing cycle is considered to be the period ranging from the beginning of active vegetative growth or flowering, continuing through active vegetative growth or flowering and fruit development and concluding with the harvesting of fruit.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination. In particular, it is essential that the trees produce a satisfactory crop of fruit in each of the two growing cycles.

### *3.4 Test Design*

The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

### *3.5 Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 5 plants or parts taken from each of 5 plants. In the case of parts of plants, the number to be taken from each of the plants should be 2.

### *3.6 Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

## **4. Assessment of Distinctness, Uniformity and Stability**

### *4.1 Distinctness*

#### *4.1.1 General Recommendations*

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

#### *4.1.2 Consistent Differences*

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

#### *4.1.3 Clear Differences*

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

### *4.2 Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.2.2 For the assessment of uniformity, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 5 plants, no off-types are allowed.

#### 4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new plant stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

### 5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Mature fruit: ratio length/width (characteristic 45);
- (b) Mature fruit: shape of ventral shoulder (characteristic 58);
- (c) Seed: embryony (characteristic 93);
- (d) Time of fruit maturity (characteristic 95).

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

### 6. Introduction to the Table of Characteristics

#### 6.1 *Categories of Characteristics*

##### 6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

### 6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by \*) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

### 6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

### 6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

### 6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

### 6.5 *Legend*

(\*) Asterisked characteristic – see Section 6.1.2

(QL) Qualitative characteristic – see Section 6.3

(QN) Quantitative characteristic – see Section 6.3

(PQ) Pseudo-Qualitative characteristic – see Section 6.3

(a)–(h) See Explanations on the Table of Characteristics in Chapter 8, Section 8.1

(+) See Explanations on the Table of Characteristics in Chapter 8, Section 8.2

7. Table of Characteristics/Tableau des caractères/Merkmalstabelle/Tabla de caracterestes

	English	français	deutsch	español	Example Varieties Exemples Beispielssorten Variedades ejemplos	Note/ Nota
1. (*)	<b>Tree: attitude of main branches</b>	<b>Arbre: port des rameaux principaux</b>	<b>Baum: Haltung der Hauptzweige</b>	<b>Changed</b>		
PQ	erect	dressé	aufrecht		Kent (ZA 2004)	1
	spreading	horizontal	waagerecht		Carabao (proposed by which country?)	2
	drooping	retombant	hängend		Sensation (OK ZA 2004)	3

ZA 2004: Does a dark green young leaf exist? Rather just light green and medium green? We have deleted the hues of anthocyanin coloration and more or less followed the ARTM proposal but after checking again we wonder whether a light brownish green (khaki) would be interpreted as 'light reddish'. Or should we say 'reddish to brownish' instead of just 'reddish'? To be discussed.

ZA 2004: This should be PQ because of intermediates between most of the states. We could have had 'anthocyanin absent/present' as a separate QL char as in our previous document but in the way we present it now there are all intensities in between the states.

2. (*)	<b>Young leaf: color</b>	<b>Jeune feuille: pigmentation anthocyanique</b>	<b>Junges Blatt: Anthocyanfärbung</b>	<b>Changed</b>

---------	----------	---------	---------	--	---------------

ZA 2003: We do length excluding peduncle and length of peduncle in separate chars.

ARTM 2003: Agree to have two chars. a) Inflorescence: length (excluding peduncle) and b) Peduncle: length

ZA 2004: TWF 2003 proposed to add an illustration for characteristics 29, 31 and 32. Should we have two chars for 29, as proposed above?

**29. Inflorescene: length Inflorescence: Blütenstand: Länge  
(\*) longueur**

QN (c)	short	courte	kurz	Carrie, Peach	3
(d)	medium	moyenne	mittel	Fascell	5
	long	longue	lang	Adams, Kent, Sheil	7

Char. 30: Comment ARTM 2004: (+) to be added.

ZA 2004: Yes, this is a problem. We normally don't give drawings for quantitative chars but in this case the question is how to measure the width.

We could give an explanation such as: 'The width is taken across the broadest part of the inflorescence with primary branches perpendicular to the axis. How do other countries do this? There are also sometimes one or two primary branches sticking out beyond the majority and we ignore them. Will such an explanation be better than a drawing?

**30. Inflorescene: width Inflorescence: Blütenstand: Breite  
largeur**

QN (c)	narrow	etroite	schmal	3
(d)	medium	moyenne	mittel	5
	broad	large	breit	7

**31. Inflorescene: ratio length/width Inflorescence: rapport longueur/largeur Blütenstand: Verhältnis Länge/Breite**

ZA 2004: TWF 2003 proposed to delete char. 67. However, one could combine 66 and 67 as follows: ‘absent or weakly expressed (1), medium (2), strongly expressed (3) or similar wording. We don’t think 66 should be a QL characteristic. It varies a lot in some varieties.

<b>66.</b>	<b>Mature fruit: bulge proximal of stylar scar</b>	<b>Fruit prêt à cueillir: excroissance proximale de la cicatrice stylaire</b>	<b>Erntereife Frucht: Auswuchs proximal von der Griffelnarbe</b>	<b>Changed</b>

## 8. Explanations on the Table of Characteristics

**TWF 2003: To be updated in accordance with the changes to the Table of Chars and Ad. 58 to 63 to add illustration showing the dorsal and ventral shoulder.**

### 8.1 *Explanations Covering Several Characteristics*

Characteristics containing the following notes in the second column of the Table of Characteristics should be examined as indicated below:

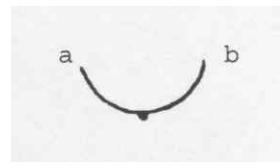

- (a) All observations on the young leaf should be made on active growth (flush).  
**Comment ARTM 2004: To be elaborated to further clarify the period of observation.**  
**ZA 2004: During flush there are very young soft leaves which in some varieties will show anthocyanin coloration. How to elaborate?**
- (b) All observations on the leaf should be on mature leaves in the middle third of the youngest shoots not showing signs of active growth. The attitude of the leaf should be observed on upward growing shoots.
- (c) Inflorescences should be selected from terminal panicles of typical shoots from the exposed regions of the tree.
- (d) Unless otherwise stated, all observations on the inflorescence and the flower should be made at the time of full flowering.
- (e) The mature fruit is the fruit at the stage ready for harvesting. This stage is reached when the flesh is still quite firm and has not become juicy but has started coloring around the stone. All fruits for observation should be harvested from the periphery of the tree and ripened at room temperature without any artificial ripening agents.
- (f) The ripe fruit is the fruit at the stage ready for consumption. This stage is reached when the flesh is juicy and has become colored from the stone to the skin.
- (g) All observations on the lenticels should be made on the lateral side of the fruit.
- (h) For observations on the length and width of the fruit, the fruit should be sawed lengthwise, through the stalk attachment and the stylar scar. For observations on the thickness, it should be sawed at right angle (perpendicular) to this. The outline may be traced and measurements made on paper. The length of the fruit is taken along the axis through the stalk attachment and the furthest point. The width is taken at the broadest part perpendicular to the length. The thickness is taken at the thickest part perpendicular to the width. '**ZA 2004: In lateral view the fruit is normally viewed with the ventral shoulder and the stylar scar to the left and with the dorsal shoulder to the right.**'

## 8.2 Explanations for individual characteristics

### Ad. 15: Leaf: shape in cross section

1  
straight

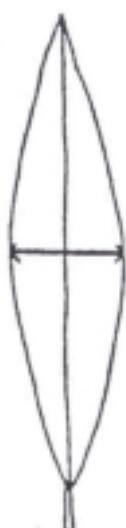

2  
concave

### Ad. 12: Leaf blade: shape

**ZA 2004:** ARTM proposed new states. Could they please provide drawings and example varieties. We only have oblong, elliptic and lanceolate.

1  
trullate to ovate

2  
Elliptic

3  
oblong

Ad. 14: Leaf blade: twisting

1  
absent

9  
present

Ad. 23: Leaf blade: shape of apex

1  
attenuate

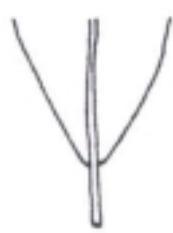

2  
acuminate

3  
acute

Ad. 24: Leaf blade: shape of base

1  
acute

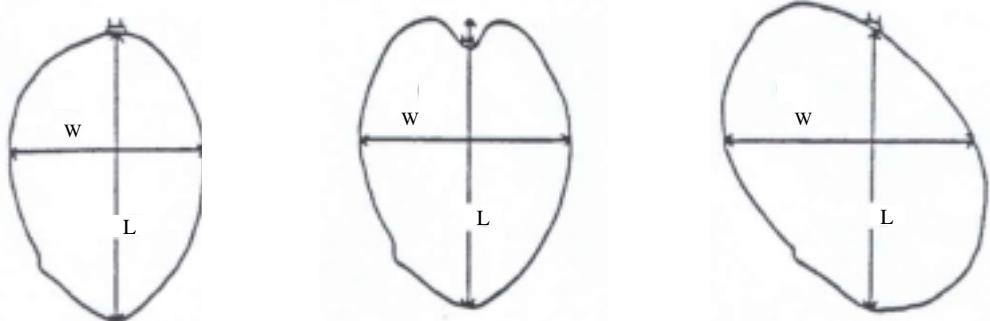

2  
obtuse

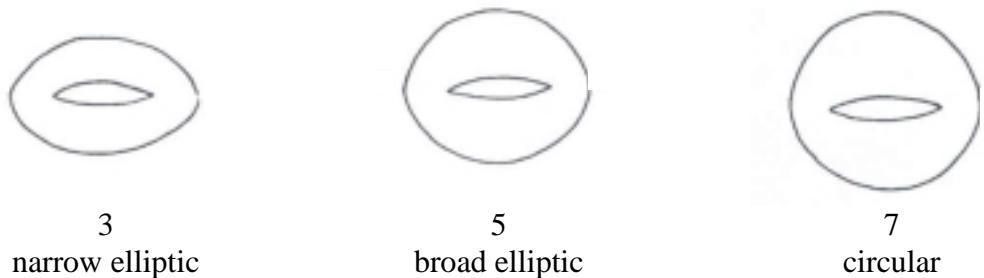

3  
rounded

**Ad. 30: Comment ARTM 2004: To explain the part of the inflorescence on which to observe the width.**

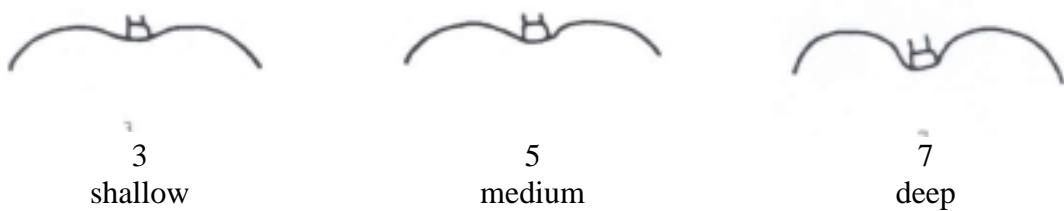

Ad. 43-45: Mature fruit: length (= L) and width (= W)

Ad. 46: Mature fruit: shape in cross section

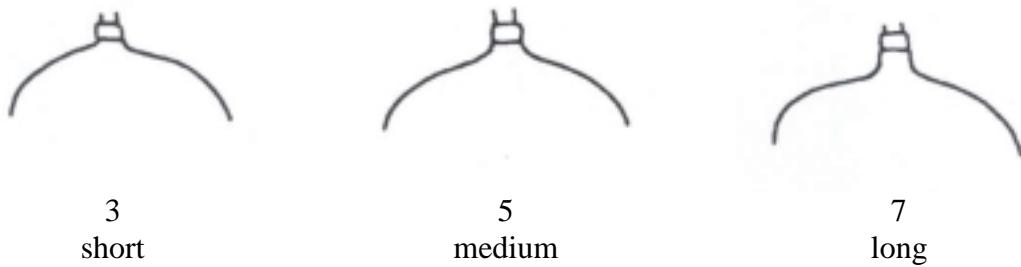

Ad. 55: Mature fruit: depth of stalk cavity

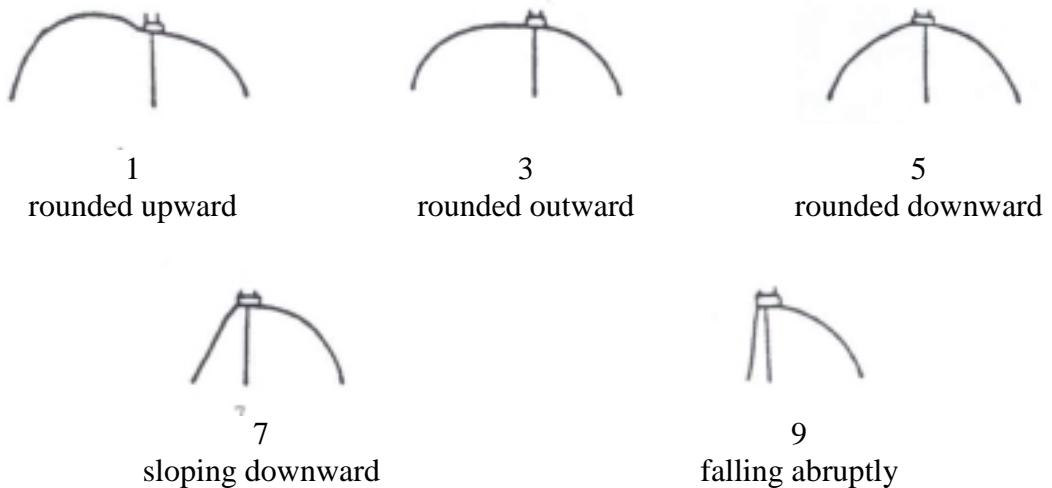

Ad. 57: Mature fruit: length of neck

**ZA 2004: Should we rather have drawings for 56 ‘presence of neck’?**

Ad. 58 + 59: Mature fruit: shape of ventral (58) and dorsal (59) shoulder

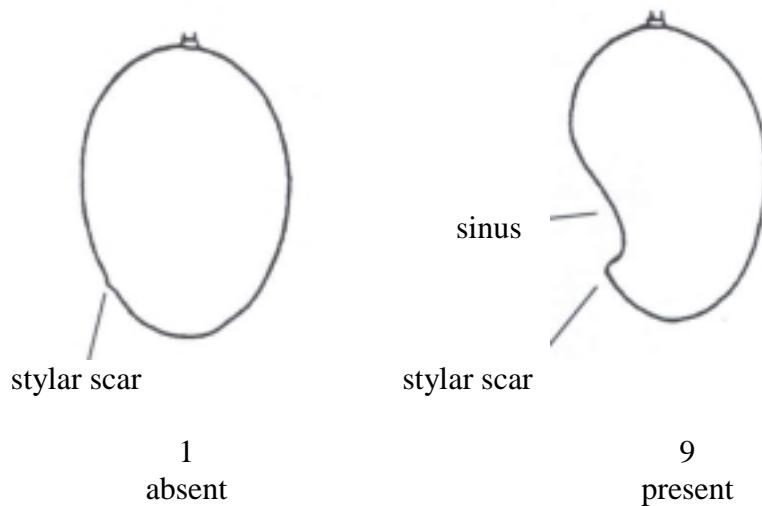

Ad. 60: Mature fruit: presence of groove in ventral shoulder

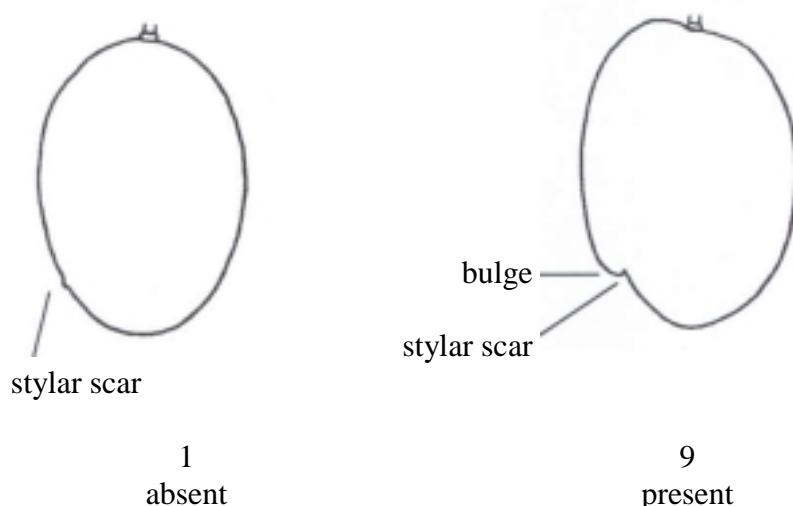

Ad. 63: Mature fruit: lumpiness on ventral shoulder

Ad. 64: Mature fruit: sinus proximal of stylar scar

Ad. 66: Mature fruit: bulge proximal of stylar scar

9. Literature

**ARTM 2003:** Relevant literature to be added.

**TWF 2003:** 'Mango Number' reference to be completed.

**ARTM 2004:** Experts from India, Philippines and TFNet to provide further literature.

**ZA 2004:** Books by Campbell? And IPGRI Descriptors?

**TWF 2003: 'Mango Number' reference to be completed.**

## 6. Similar varieties and differences from these varieties

*Please use the following table and box for comments to provide information on how your candidate variety differs from the variety (or varieties) which, to the best of your knowledge, is (or are) most similar. This information may help the examination authority to conduct its examination of distinctness in a more efficient way.*

Denomination(s) of variety(ies) similar to your candidate variety	Characteristic(s) in which your candidate variety differs from the similar variety(ies)	Describe the expression of the characteristic(s) for the <b>similar</b> variety(ies)	Describe the expression of the characteristic(s) for <b>your</b> candidate variety
<i>(Example)</i>			

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

#7. Additional information which may help in the examination of the variety

7.1 In addition to the information provided in sections 5 and 6, are there any additional characteristics which may help to distinguish the variety?

Yes [ ] No [ ]

(If yes, please provide details)

7.2 Special conditions for the examination of the variety

7.2.1 Are there any special conditions for growing the variety or conducting the examination?

Yes [ ] No [ ]

7.2.2 If yes, please give details:

7.3 Other information

A representative color photograph of the variety should accompany the Technical Questionnaire.

8. Authorization for release

(a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes [ ] No [ ]

(b) Has such authorization been obtained?

Yes [ ] No [ ]

If the answer to (b) is yes, please attach a copy of the authorization.

#

Authorities may allow certain of this information to be provided in a confidential section of the Technical Questionnaire.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

9. Information on plant material to be examined.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- |   |         |        |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma)      | Yes [ ] | No [ ] |
| (b) Chemical treatment (e.g. growth retardant or pesticide) | Yes [ ] | No [ ] |
| (c) Tissue culture  | Yes [ ] | No [ ] |
| (d) Other factors   | Yes [ ] | No [ ] |

Please provide details of where you have indicated “yes”.

.....

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:
