INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS
 GENEVA

DRAFT

PEAS

UPOV code: PISUM_SAT

Pisum sativum L.

*

GUIDELINES
FOR THE CONDUCT OF TESTS
FOR DISTINCTNESS, UNIFORMITY AND STABILITY

prepared by an expert from the United Kingdom

*to be considered by the
 Technical Working Party for Vegetables at its thirty-eighth session,
 to be held in Seoul, from June 7 to 11, 2004
 and*

*Technical Working Party for Agricultural Crops at its thirty-third session
 to be held in Poznan, Poland, from June 28 to July 2, 2004*

Alternative Names:^{*}

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Pisum sativum L.</i>	Peas	Pois	Erbse	Guisante, Arvejo

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

ASSOCIATED DOCUMENTS

These guidelines (“Test Guidelines”) should be read in conjunction with document TG/1/3, “General Introduction to the Examination of Distinctness, Uniformity and Stability and the Development of Harmonized Descriptions of New Varieties of Plants” (hereinafter referred to as the “General Introduction”) and its associated “TGP” documents.

Other associated UPOV documents:

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Pisum sativum* L. .

General Issues to be considered under Section 1 (Summary by the Leading expert)

1. Should we split the guideline into Agricultural and Vegetable Peas?

I am not aware of any character in the current guideline which can clearly separate agricultural peas from vegetable peas. All characters could be used in both Agricultural and Vegetable varieties, even though some combinations may be unlikely. Obviously we want to avoid recording characteristics which have no relevance to the candidate, but in some types of Pea (e.g. semi-leafless protein), we need many characteristics for Distinctness.

- UK In my opinion, we cannot separate agricultural and vegetable peas on the basis of morphological characters.*
- CZ: We agree not to separate agricultural and vegetable peas*
- FR: We agree your proposition about agricultural and vegetable peas. For us, it's very difficult to split in two groups.*
- DE: We fully support that it is not possible to separate guidelines*
- HU: Hungary is in favour of not splitting the species Pisum into two TG.*
- ISF: Agree not to separate*
- JP: Same opinion*
- NL: We agree not to split*
- PL: We should not separate agricultural and vegetable peas*
- SK: Agree not to split*

Consensus: Do not split Vegetable and Agricultural Peas

2. Should we split Peas into Cultivar Groups representing the main use types?

Varieties could be separated into Cultivar Groups using a key:

- Sugar Peas [Saccharatum Group](defined by thin entire, incomplete or absent pod parchment) including varieties with and without anthocyanin pigmentation.
- Forage Peas [Arvense Group](defined by the presence of anthocyanin) excluding coloured flowered Sugar types
- Semi-leafless Peas [Afila Group] (defined by absence of leaflets)
- Leafy Peas with Simple Starch Grains (excluding Sugar and Forage types)
- Leafy Peas with Compound Starch Grains (excluding Sugar and Forage Types)

Appropriate names are still required for all the Cultivar Groups.

Classification into Cultivar Groups will mean that the same uniformity standard would not be applied across all Groups. Within each Group we would expect the uniformity of character expression from variety to variety to be broadly similar, but the uniformity could be very different between Groups (e.g. Forage Pea and a Processing Pea).

- CZ We are against classification into Cultivar Groups on the basis of the main use types especially with respect to the assessment of uniformity. In our opinion the same uniformity standard should be applied across the whole species Pisum*

- FR We could accept proposal to split in cultigroups, but propose more subdivisions
Sugar Peas: round pod/flat pod
Semi-leafless simple/ compound starch grain
Needs more discussion*
- DE There is no clear morphological separation between use types. We do not think that it is appropriate to have different uniformity levels in relation to the use. We do not want to split.*
- HU: Cultivar grouping is acceptable for our pea experts*
- ISF Preference is not to split*
- NL: Splitting eventually in Sugar Peas and the rest. For us it is not very useful to split into more than these groups*
- PL This a matter for discussion*
- SL Agree in general but in the last two groups: Leafy Peas with Simple Starch Grains and Leafy Peas with Compound Starch Grains we have not good experience because this characteristics were not observed precisely*
- UPOV: The UPOV Convention treats uniformity of a variety according to “the particular features of its propagation” and not, for example, according to its use. Therefore, different uniformity standards for different groups would need to be linked to types of propagation and not particular characteristics.*

This is not a discussion about classification on Use. The different cultivar groups proposed have different uses, but are clearly distinguished on morphological characteristics. Some have different breeding/maintenance methods which result in different levels of uniformity e.g. many forage peas are populations and are maintained as such; they have not been bred by the single seed descent method. Many old varieties are maintained in this way and will have a lower level of uniformity. Some varieties have been bred by combining good performing types (either populations or family lines) and then ‘rogued’ after F6 to remove obvious off-types - these varieties will never be as uniform as those arising from the single seed descent method, but may be more uniform than populations.

3. Should we separate characteristics on the basis of dependency?

Define sets of characteristics used depending on the type of material

- Core characteristics (record for all Groups)
plus appropriate characteristics from
- Characteristics dependent on the presence of anthocyanin
- Characteristics dependent on the absence of parchment
- Characteristics dependent on the presence of leaflets
- Characteristics dependent on the presence of simple starch grains
- Characteristics dependent on the presence of compound starch grains

If we split varieties into Groups, this proposal may have some merit, but I could live with characteristics listed in the same way as the current guideline (see next option).

- CZ: Not to split*
- DE: Keep as it is*
- HU: agrees to the separation of the characteristics*
- ISF Do not split – dependency is already considered*

- NL: Not very useful to do this. It gets more complicated and does not provide much extra information and clearness*
PL: This a matter for discussion
SL: Yes, it is easier for an expert who tests different type of material to sort the characteristics and to work with the guideline

There is not a clear consensus.

4. Should we retain the layout of characteristics as in the existing guideline?

All characteristics would be in one list with specified dependency or exclusion, where necessary.

Majority say no change.

CZ DE HU ISF NL PL: to keep it as it is

- SL: see in 3 (Yes it is easier for an expert who tests different type of material to sort the characteristics and to work with the guideline)*

5. Additional characteristics

Should there be a list of characteristics which are not routinely used, but could, when required, be used for Distinctness (e.g. waxless types, characteristics which distinguish very few varieties etc.)

For:

- CZ: this list could be useful but we are afraid according to TGP 7 there is no possibility to include a special list of not routinely observed characteristics into the official guideline. Where this list would be stated?*
HU: Such a list seems to be useful
*ISF: Additional characters can be added, but the large majority have to be measured routinely.
Electrophoresis can be added here.*
SL Agree

Against:

- DE We are not in favour to have any kind of additional list in the guidelines. All characteristics which are useful and necessary for routine establishment of distinctness should be included in the table of characteristics. In any case it is possible to use for a specific pair of varieties an appropriate additional characteristic which is not in the guidelines. It was discussed in UPOV to collect information about such cases on the UPOV website but up to now such approach is not yet established.*
NL: not really necessary. There are not much of these characteristics
PL Do not agree
*UPOV The General Introduction (TG/1/3: Section 4.8: Table) clarifies that the characteristics in the UPOV Test Guidelines do not have to be used by a particular authority, or equally can be used on a “non-routine” basis thus:
Standard Test Guidelines Characteristics:
Characteristics that are accepted by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.*

The only characteristics which need to be examined by all authorities on a regular basis are the asterisked characteristics.

In the past, perhaps, there was a tendency to include only characteristics used by (all) authorities on a regular basis. With increasing membership of UPOV it is now recognized that there will be some characteristics which are not examined by all members of the Union, but which are appropriate characteristics for at least some members of the Union. Of course, this should be seen in the context of harmonizing characteristics as far as possible, which means that we should still strive, in general, to identify characteristics in the Test Guidelines which are used by all members of the Union.

The functions of “Additional characteristics” are referred to in the General Introduction (Section 4.8: Table) as:

1. *To identify new characteristics, not included in the Test Guidelines, that have been used by members of the Union in the examination of DUS and which should be considered for inclusion in future Test Guidelines.*
2. *To facilitate harmonization in the development and use of new characteristics and provide opportunity for expert review.*

This definition is intended to clarify that additional characteristics are those which UPOV is still considering from the point of view of whether they meet the criteria for inclusion in the Table of Characteristics. At the revision of the Test Guidelines these additional characteristics should, if they meet the criteria, be included as standard Test Guidelines characteristics or, if they do not meet the criteria, be deleted from the list of “additional characteristics”. Thus, they are not intended as a list of “non-routine” characteristics.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

1,000 g

2.4 The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. In cases where the seed is to be stored, the germination capacity should be as high as possible and should, be stated by the applicant.

2.5 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.6 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

3.3.1 The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.3.2 The optimum stage of development for the assessment of each characteristic is indicated by a number in the second column of the Table of Characteristics. The stages of development denoted by each number are described at the end of Chapter 8.

(iii) The recommended method of observing the characteristic is indicated by the following key in the second column of the Table of Characteristics:

MG: single measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by a single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

(iv) The recommended type of plot in which to observe the characteristic is indicated by the following key in the second column of the Table of Characteristics:

A:	spaced plants
B:	row plot
C:	special test

3.4 *Test Design*

(iii) Each test should be designed to result in a total of at least 100 plants, which should be divided between two or more replicates.

The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 20 plants or parts taken from each of 20 plants.

3.6 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity, a population standard of 1 % and an acceptance probability of at least 95 % should be applied. In the case of a sample size of 100 plants, 3 off-types are allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Seed: shape of starch grain (characteristic 2)
- (b) Seed: color of cotyledon (characteristic 3)
- (c) Varieties with anthocyanin only: Seed: marbling of testa (characteristic 4)
- (d) Varieties with anthocyanin only: Seed: violet or pink spots on testa (characteristic 5)
- (e) Seed: black color of hilum (characteristic 6)
- (f) Plant: anthocyanin coloration (characteristic 9)
- (g) Leaf: leaflets (characteristic 19)
- (h) Stipule: type of development (characteristic 28)
- (i) Stipule: 'rabbit-eared' stipules (characteristic 29)
- (j) Stipule: flecking (characteristic 33)
- (k) Pod: parchment (characteristic 50)
- (l) Varieties with no or partial parchment only: Pod: thickened wall (characteristic 51)
- (m) Varieties without thickened pod wall only: Pod: shape of distal part (characteristic 54)
- (n) Pod: color (characteristic 55)
- (o) Pod: intensity of green color of immature seed (characteristic 61)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 *Legend*

- | | | |
|------|-----------------------------------|---------------------------------|
| (*) | Asterisked characteristic | – see Chapter 6 (Section 6.1.2) |
| (QL) | Qualitative characteristic | – see Chapter 6 (Section 6.3) |
| (QN) | Quantitative characteristic | – see Chapter 6 (Section 6.3) |
| (PQ) | Pseudo-qualitative characteristic | – see Chapter 6 (Section 6.3) |

ASW 11

(+) See Explanations on the Table of Characteristics in Chapter 8.

7. Table of Characteristics/Tableau des caractères/Merkmalstabelle/Tabla de caracteres

English	français	deutsch	español	Example Varieties/ Exemples/ Beispielssorten/ Variedades ejemplo	Note/ Nota
---------	----------	---------	---------	---	---------------

Proposal to modify: Dry seed characters

1. HU allocate seed characters 1-8 to those starting from char. 62. All seed characters to be tested on harvested seed

2. UK Add qualification? 1-8 submitted seed; 62-65 harvest seed

CZ DE NL Not necessary – mentioned in Chapter Methods and Observation

1.	00	Seed: shape VG	Graine: forme	Samen: Form		
PQ	(b)	spherical	sphérique	kugelförmig	Chipeau, Lisana	1
		ovoid	ovoïde	eiförmig	Birte, Solara	2
		cylindrical	cylindrique	zylindrisch	Span, Timo	3
		rhomboid	rhomboïde	rhomboid	Maro, Progreta	4
		triangular	triangulaire	dreieckig	Protor	5
		irregular	irrégulièrē	unregelmässig	Géant à fleur violette	6
2.	00	Seed: shape of (*) starch grain (+)	Graine: forme du grain d'amidon	Samen: Form des Stärkekorns		
QL		simple	lisse	einfach	Maro, Solara, Zorba	1
		compound	étoilé	zusammengesetzt	Avola, Polar	2

UK Proposal to modify: Change to 'Seed: type of starch grains'. FR DE PL SK agree.

3.	00	Seed: color of VG cotyledon	Graine: couleur des cotylédons	Samen: Farbe des Keimblatts		
QL	(b)	green	verts	grün	Avola, Solara	1
		yellow	jaunes	gelb	Birte, Nadja	2

UK Proposal to modify: Add an new state: 'orange' with note '3' Example variety 'Oliver'. Add an explanation. FR DE NL PL SK agree.

CZ Sometimes yellow color of cotyledon has tendency to become orange after storage (see Photograph of 'MENHIR')

4.	00	<u>Varieties with anthocyanin only</u> Seed: marbling of testa	<u>Variétés avec anthocyanine</u> <u>seulement:</u> Graine: marbrure des téguments	<u>Nur Sorten mit Anthocyan:</u> Samen: Marmorierung der Samenschale		
QL	(b)	absent	absente	fehlend	Nadja	1
		present	présente	vorhanden	Tombola	9

					Example Varieties/ Exemples/ Beispielssorten/ Variedades ejemplo	Note/ Nota
		English	français	deutsch	español	
5.	00	Varieties with anthocyanin only: Seed: violet or pink spots on testa	Variétés avec anthocyanine seulement: Graine: taches violettes ou roses sur les téguments	Nur Sorten mit Anthocyan: Samen: Anthocyan: Graine: violette oder rosa Punktierung auf der Samenschale		
(*)	VG					
QL	(b)	absent	absentes	fehlend	Nadja, Tombola	1
		faint	faibles	gering	Assas, Susan	2
		intense	intenses	intensiv	Arvika, Livia	3
6.	00	Seed: black color of hilum	Graine: couleur noire du hile	Samen: schwarze Nabelfarbe		
(*)	VG					
QL	(b)	absent	absente	fehlend	Avola, Nadja	1
		present	présente	vorhanden	Nofila, Poneka	9

UK Proposal to modify: Change to 'Seed: hilum color' with states 'black 1 not black 2'

- FR NL SK agree
- DE PL Prefer to keep because better in accordance with field and broad bean

7.	00	Varieties with anthocyanin only: Seed: color of testa	Variétés avec anthocyanine seulement: Graine: couleur du tégument	Nur Sorten mit Anthocyan: Samen: Farbe der Samenschale		
QL/	PQ?	(b) reddish brown	brun rougeâtre	rötlichbraun	Golf, Rosakrone	1
		brown	brun	braun	Poneka	2
		brownish green	vert brunâtre	bräunlichgrün	Lisa, Susan	3

UK Proposal to delete: Not very useful? States 1 and 2 reflect flower colour (char. 38)

- FR NL agree to delete
- DE Keep – good differentiation between varieties, no clear correlation to flower color

PL No. It is important for varieties with anthocyanin pigmentation

8.	00	Varieties with unwrinkled seed and simple starch grains only: Seed: dimpled cotyledons	Variétés avec graines sans rides et avec grains d'amidon lisses seulement: Graine: fossettes sur les cotylédons	Nur Sorten mit Samen ohne Schrumpfung und mit einfachen Stärkekörnern: Samen: Grübchen des Keimblatts		
(+)	VG					
QL	(b)	absent	absentes	fehlend	Birte, Solara	1
		present	présentes	vorhanden	Maro, Progreta	9

					Example Varieties/ Exemples/ Beispielssorten/ Variedades ejemplo	Note/ Nota
	English	français	deutsch	español		
9.	00 - 320 VG	Plant: anthocyanin coloration	Plante: pigmentation anthocyanique	Pflanze: Anthocyan-färbung		
		QL absent	absente	fehlend	Avola, Solaria	1
		present	présente	vorhanden	Nadja, Rosakrone	9
10.	218 MG/ (+)	Plant: height	Plante: hauteur	Pflanze: Höhe

		short	petite	niedrig	Birte, Mini	
		medium	moyenne	mittel	Lord Chancellor, Minor	5
		tall	grande	hoch	Blauwschokker, Livia	7
		very tall	très grande	sehr hoch	Enka	9

UK Proposal to modify: add qualification 'at 30% flowering'

• NL PL SK agree; FR Prefer to keep at end of flowering period

CZ Proposal to modify: Split character into vegetable non-sugar types and others

DE Proposal to modify: Plant: height at time of flowering. In general the order of characteristics should be changed according to the time of observation i.e. move char. 10 after char 36.

HU Proposal to modify: Record at Stage 240 green seed fully developed

11.	30- 199 VG	Stem: fasciation	Tige: fasciation	Stengel: Verbänderung		
QL		absent	absente	fehlend	Avola	1
		present	présente	vorhanden	Golf, Rosakrone	9

		English	français	deutsch	español	Example Varieties/ Exemples/ Beispielssorten/ Variedades ejemplar	Note/ Nota
12.	240	Stem: length	Tige: longueur	Stengel: Länge			
(*)	MS						
(+)							
QN		very short	très petite	sehr kurz		Elma	1
		short	petite	kurz		Birte, Mini	3
		medium	moyenne	mittel		Lord Chancellor, Minor	5
		long	grande	lang		Blauwschokker, Livia	7
		very long	très grande	sehr lang		Enka	9

UK Proposal to delete: too expensive to measure (replace by plot a single plot height measurement)..

- CZ could agree, but if kept as it is, split character into vegetable non-sugar types and others
- FR Do not agree
- DE Keep because very valuable char. Not to be replaced by new char.
- NL Only OK if new characteristic is added
- PL No. Length is not the same as height
- SK Within our trial designs and growing conditions – for the field types we have metal constructions – so there is no problem to measure and for the garden types our experts prefer single plot height measurements – so both is useful.

UK Proposal to modify: If retained delete asterisk

13.	230 – Stem: number of 240 nodes up to and MS including first fertile node	Tige: nombre de noeuds jusqu'au premier noeud fertile inclus	Stengel: Anzahl Knoten bis einschliesslich des ersten Blütenstandes

UK Proposal to modify: Change states to 'very low 1' to 'very high 9'

FR DE NL SK agree

Proposal to modify: (for all disease characters 66-72)

1. Delete 'cv.' for all example varieties as the abbreviation is no longer accepted under international nomenclature. UK FR DE NL agree

2. Recording method: NL Our opinion all scored VS. One observes resistance/susceptibility on single plants.

The ratio susceptible/resistant gives the final observation (resistant, susceptible, segregating) for the variety.

8. Explanations on the Table of Characteristics

8.1 Explanations covering several characteristics

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) Foliage and pod: Unless otherwise indicated, all observations on the foliage and the pod should be made before green harvest maturity.
- (b) Seed: All observations on the seed should be made on dry seed and, with the exception of characteristics 2 and 9, on seed harvested on the plots.

8.2 Explanations for individual characteristics

[Still to be prepared]

Ad.65: Seed: weight

The seed weight should be measured on 2 samples of 100 seeds.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- (a) Microorganisms (e.g. virus, bacteria, phytoplasma) Yes [] No []
- (b) Chemical treatment (e.g. growth retardant, pesticide) Yes [] No []
- (c) Tissue culture Yes [] No []
- (d) Other factors Yes [] No []

Please provide details of where you have indicated “yes”.

.....

ASW 17

9.3 Has the plant material to be examined been tested for the presence of virus or other pathogens?

Yes []

(please provide details as specified by the Authority)

No []

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:
