INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS
 GENEVA

DRAFT

PINEAPPLE
 (edible varieties)

UPOV Code: ANANA_COM

Ananas comosus (L.) Merr.

*

GUIDELINES

FOR THE CONDUCT OF TESTS

FOR DISTINCTNESS, UNIFORMITY AND STABILITY

*prepared by an expert from France on the basis of documents:
 France Cirad August 2000; Brazil May 2004*

*to be considered by the
 Technical Working Party for Fruit Crops at its thirty-fifth session,
 to be held in Marquardt (Potsdam), Germany, from July 19 to 23, 2004*

Alternative Names:^{*}

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Ananas comosus</i> (L.) Merr.	Pineapple	Ananas	Ananas	Piña

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These guidelines (“Test Guidelines”) should be read in conjunction with document TG/1/3, “General Introduction to the Examination of Distinctness, Uniformity and Stability and the Development of Harmonized Descriptions of New Varieties of Plants” (hereinafter referred to as the “General Introduction”) and its associated “TGP” documents.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of Pineapple (*Ananas comosus* (L.) Merr.) produced for fruit consumption.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of suckers.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

40 suckers.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5. The plant material should be healthy, sturdy and free from pests and diseases, mealy bug wilt and *fusariosis* in particular. In any case a sucker shall be taken from a plant showing wilt symptoms.

2.6 The size of the suckers should be homogenous and their quality should be sufficient enough to meet the requirements for planting.

2.7 The suckers should conform to the original mother plant characteristics (spines, color, etc.). Only one type of sucker should be represented (aerial suckers, peduncle slips, crowns, etc.).

2.8 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two delayed production cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 Conditions for Conducting the Examination

3.3.1 The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.3.2 The optimum stage of development for the assessment of each characteristic is indicated by a code in the first column of the Table of Characteristics:

- 1-T: Floral induction provoked
- 2-A: Anthesis stage
- 3-I: Immature fruit stage
- 4-M: Maturity stage.

3.4 Test Design

3.4.1 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.4.2 Suckers are planted in twin lines, distance between individual lines is 40 cm, distance between two successive suckers within a line is 30 cm. Distance between twin lines is 90 cm.

3.4.3 Floral induction should be provoked (forcing) according to the best plant development stage.

3.5 Number of Plants / Parts of Plants to be Examined

Unless otherwise indicated, all observations should be made on { x } plants or parts taken from each of { x } plants. In the case of parts of plants, the number to be taken from each of the plants should be 2.

3.6 Additional Tests

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 Distinctness

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 40 plants, 3 off-types are allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new plant stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded

from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics: (to review)

It is recommended that the competent authorities divide the triploid varieties (the AAA group) of *Musa acuminata* into subgroups and types which can be identified by the following characteristics:

- (a) Leaf: leaf edges aspect (piping/not piping) (characteristic 14)
- (b) Leaf: aspect of not-piping leaf edges (characteristic 15)
- (c) Fruit: shape when ripe (characteristic 53)
- (d) Fruit: predominant color when ripe (characteristic 54)
- (e) Fruit: eye profile (characteristic 68)
- (f) Fruit/flesh: color (characteristic 71)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 Example Varieties

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 Legend

(*) Asterisked characteristic – see Chapter 6 (Section 6.1.2)

QL Qualitative characteristic – see Chapter 6 (Section 6.3)

QN Quantitative characteristic – see Chapter 6 (Section 6.3)

PQ Pseudo-qualitative characteristic – see Chapter 6 (Section 6.3)

(a)-(f) See Explanations on the Table of Characteristics in Chapter 8.1

(+) See Explanations on the Table of Characteristics in Chapter 8.

1-T See Chapter 3 (Section 3.3.2)

2-A See Chapter 3 (Section 3.3.2)

3-I See Chapter 3 (Section 3.3.2)

4-M See Chapter 3 (Section 3.3.2)

7. Table of Characteristics/Tableau des caractères/Merkmalstabelle/Tabla de caracteres

NOTE: 1st column: **xF** refers to the French (FR) doc.
Brx refers to the Brazilian (BR) doc.

7th column Example varieties or RHS color code:

8. Explanations on the Table of Characteristics

8.1 *Explanations covering several characteristics*

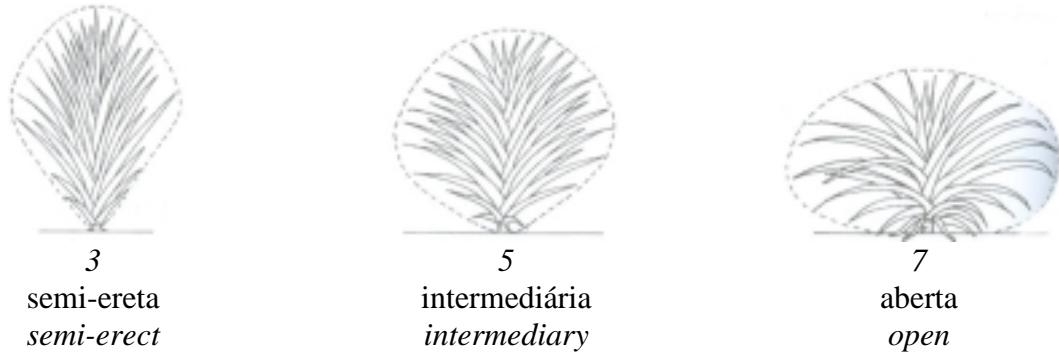

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) (Characteristics 1 to 18) All observations related to the vegetative characters should be made on 20 plants or parts of them at the time floral induction is provoked (about 8 months after planting—stage 1-T).
- (b) (Characteristics 3 to 5) The *reference leaf* is the longest at the time floral induction is provoked. Measurements to be taken on 20 leaves.
- (c) (Characteristics 19 to 30): Observations related to flowering, inflorescence and flowers should be made on 20 inflorescences, at the time of anthesis (stage 2-A). Measurements of floral parts to be taken on 10 flowers removed at mid-anthesis.
- (d) (Characteristics 31 and 32): Observations of fruits before maturity should be made on 20 fruits, 4 months after floral induction is provoked (immature fruit—stage 3-I).
- (e) (Characteristics 33 to 85): Qualitative observations related to plant and fruit at harvest should be made in the plot on 20 plants and 20 fruits. It is considered that harvest time is the stage at which the fruit is good to be eaten (actual maturity—stage 4-M). Measures to be made on 10 fruits.
- (f) (Characteristics 83 to 85): Analysis should be made on 10 different juices taken from each of 10 fruits. Methods are appended to this document (appendix 1).

8.2 Explanations for individual characteristics

OBSERVAÇÕES E FIGURAS / OBSERVATIONS AND FIGURES FROM BRAZIL (Br(+)) Characteristics)

Característica Br1: Planta: posição das folhas / Characteristic Br1: Plant: attitude

Característica Br2: Planta: quantidade de folhas ativas / Characteristic Br2: Plant: number of active leaves

Aproximadamente considera-se:

(In approach, we can consider / We can consider near by)

- baixa (low) < 40
- média (medium) 40 – 60
- alta (high) > 60

Característica Br3: Folha: comprimento / Characteristic Br3: Leaf: length

Aproximadamente considera-se:

(In approach, we can consider / We can consider near by)

- curto (short) < 90 cm
- médio (medium) 90 – 120 cm
- longo (long) > 120 cm

Característica Br4: Folha: largura / Characteristic Br4: Leaf: width

Aproximadamente considera-se:

(In approach, we can consider / We can consider near by)

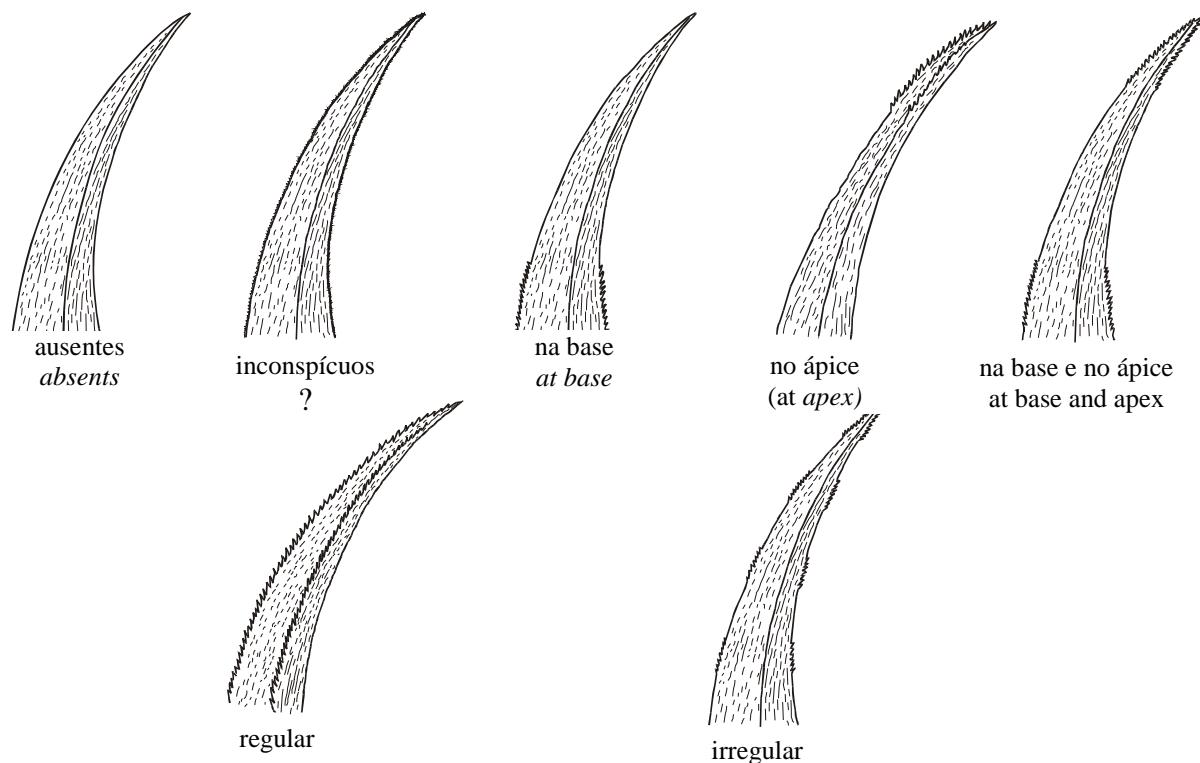

- estreita (narrow) < 6,0 cm
- média (medium) – 6,0 a 7,0 cm
- larga (broad) > 7,0 cm

Característica Br8: Folha: espinhos / Characteristic Br8: Leaf: spines

Característica Br9: Folha: distribuição dos espinhos na margem / Characteristic Br9: Leaf: distribution of spines at margin

Inconspícuos são espinhos microscópicos que podem ser detectados através do tato. Passando-se a mão nas margens das folhas tem-se a sensação de se sentir uma lixa. (“Inconspícuos” are microscopic spines, which can be detected through the sense of touch. When we touch our hands at the margins of leaves, we feel that it’s like a sandpaper.)

São considerados espinhos conspícuos aqueles visíveis a olho nú. (“Conspícuos” are spines, which are visible with the naked eye.)

(Desenho adaptado por Maria da Conceição Borba)

Característica Br10: Inflorescência: quantidade de flores / Characteristic Br10: Inflorescence: number of flowers

Aproximadamente considera-se:

(In approach, we can consider / We can consider near by)

- baixa (low) < 130
- média (medium) 130 - 170
- alta (high) > 170

Característica Br15: Flor: proporção da coloração branca na pétala / Characteristic Br15:
Flower: ratio of the white color in the petal

Aproximadamente considera-se:

(*In approach, we can consider / We can consider near by*)

- baixa (*low*) < 30 %
- média (*medium*) 30 – 60 %
- alta (*high*) > 60 %

Característica 18: Flor: comprimento do estilete / Characteristic Br18: Flower: length of style

brevistilo: mais curto que os estames
shorter than the stamens

eqüistilo: do mesmo comprimento dos estames
with the same length of the stamens

longistilo: mais longo que os estames
longer than the stamens

Característica Br19: Rebentões: quantidade / Characteristic Br19: Suckers: number

Aproximadamente considera-se:

(*In approach, we can consider / We can consider near by*)

- baixa (*low*) < 1
- média (*medium*) 1 - 2
- alta (*high*) > 2

Característica Br20: Pedúnculo: comprimento / Characteristic Br20: Peduncle: length

Aproximadamente considera-se:

(*In approach, we can consider / We can consider near by*)

- curto (*short*) < 18 cm
- médio (*medium*) 18 – 28 cm
- longo (*long*) > 28 cm

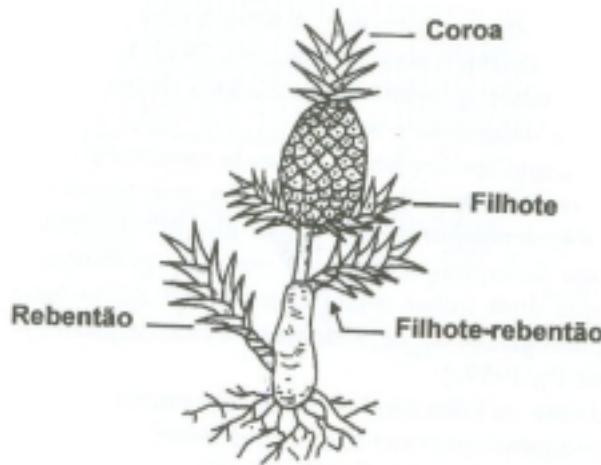

Característica Br21: Pedúnculo: diâmetro na porção mediana / Characteristic Br21:
Peduncle: diameter at the middle portion

Aproximadamente considera-se:

(*In approach, we can consider / We can consider near by*)

- pequeno (*small*) < 2,5 cm
- médio (*medium*) 2,5 – 3,5 cm
- grande (*large*) > 3,5 cm

Característica Br22: Pedúnculo: quantidade de filhotes / Characteristic Br22: Peduncle: number of slips

Aproximadamente considera-se:

- baixa (low) < 5
- média (medium) 5 – 10
- alta (high) > 10

Característica Br26: Fruto: comprimento. Medido da base até o topo sem considerar a coroa / Characteristic Br26: Fruit: length. Measured from base to top without consider the crown

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- curto (short) < 15 cm
- médio (medium) 15 – 20 cm
- longo (long) > 20 cm

Característica 27: Fruto: diâmetro basal / Characteristic Br27: Fruit: diameter of base

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- pequeno (small) < 10 cm
- médio (medium) 10 – 12 cm
- grande (large) > 12 cm

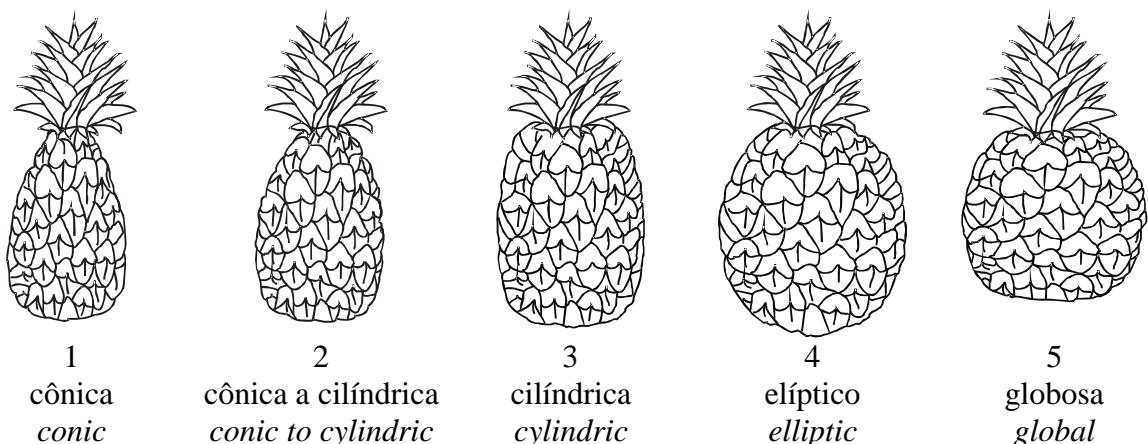

Característica 29: Fruto: diâmetro apical / Characteristic Br29: Fruit: diameter of tip

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- pequeno (small) < 6 cm
- médio (medium) 6 - 10 cm
- grande (large) > 10 cm

Característica Br30: Fruto: forma / Characteristic Br30: Fruit: shape

Característica Br34: Fruto: quantidade de filhotes basais / Characteristic Br34: Fruit: number of fruit basal slips

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- baixa (low) < 1
- média (medium) 1 – 2
- alta (high) > 2

Característica Br41: Fruto: diâmetro do eixo central / Ad. Br41: Fruit: diameter of central axis

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- pequeno (small) < 1,5 cm
- médio (medium) 1,5 – 2,5 cm
- grande (large) > 2,5 cm

Característica Br42: Fruto: concentração de sólidos solúveis (graus Brix) / Characteristic Br42: Fruit: concentration of soluble solids (Brix degrees)

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- baixo (low) < 13
- médio (medium) 13 – 16
- alto (high) > 16

Característica Br43: Fruto: acidez (titulada em percentagem) / Characteristic Br43: Fruit: acidity (fixed in percentage)

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- baixa (low) < 0,5
- média (medium) 0,5 – 0,7
- alta (high) > 0,7

Característica Br46: Coroa: comprimento / Characteristic Br46: Crown: length

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- curto (short) < 15 cm
- médio (medium) 15 – 20 cm
- longo (long) > 20 cm

Característica Br47: Coroa: peso / Characteristic Br47: Crown: weight

Aproximadamente considera-se:

(In approach we can consider / We can consider near by)

- baixo (low) < 100 g
- médio (medium) 100 – 130 g
- alto (high) > 130 g

8.3 APPENDIX: Methods of measurements (pineapple juice) from France Cirad

Juice

The juice is squeezed out from pineapple flesh and strained through muslin. It can be frozen to be used later.

Sugar content (character 85)

Sugar content (Brix value) is recorded via refractometer. It is given as a percentage (%Brix).

Free acid content (character 84)

Free acid content is determined by titration of 10 ml filtered juice with 0.1 NaOH with phenolphthaleine as indicator. The result is given in meq per 100 ml of juice (meq/100ml).

Ascorbic acid content (character 83)

Ascorbic acid content is determined by titration with 2,6-dichlorophenol-indophenol (DCPIP). It is compared to a control scale (see below). Measure is brought to 100 ml of juice and is given in mg/100ml.

Reagents

Sol 1 : Metaphosphoric acid 2 % / TCA 4 %

Dissolve 2 mg metaphosphoric acid and 4 mg trichloroacetic acid in 100 ml distilled water.

Sol 2 : DCPIP 250 mg/l

Dissolve 125 mg 2,6-dichlorophenol-indophenol in 500 ml warm distilled water, then filter

Add 104 mg sodium bicarbonate

Note: Dissolved DCPIP is unstable. Protect from light.

Sol 3 : Ascorbic acid control

Dissolve 50 mg ascorbic acid in 100 ml Sol 1 + 100 ml distilled water

Control

Ascorbic acid content (mg):	0	0.25	0.50	0.75	1.0	1.25
Sol 3 (ml)	0	1	2	3	4	5
Sol 1 (ml)	4	3.5	3	2.5	2	1.5
Distilled water (ml)	4	3.5	3	2.5	2	1.5

Titration

Add 4 ml Sol 1 to 4 ml juice. Pour slowly Sol 2 until pink coloration appears. Compare the volume poured to the control scale to determine the ascorbic acid content within 4 ml juice.

Note: if acid ascorbic measurement should be made later, add 4 ml Sol 1 to 4 ml juice immediately after it has been squeezed and strained (e.g. before freezing).

-------------------------	-----------------	-------------------

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes [] | No [] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [] | No [] |
| (c) Tissue culture | Yes [] | No [] |
| (d) Other factors | Yes [] | No [] |

Please provide details of where you have indicated “yes”.

.....

9.3 Has the plant material to be examined been tested for the presence of virus or other pathogens?

Yes []

(please provide details as specified by the Authority)

No []

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:

Applicant's name
