

**INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS**  
GENEVA

**DRAFT**

**SWEET PEPPER, HOT PEPPER,  
PAPRIKA, CHILI**

UPOV Code: CAPSI\_ANN

*Capsicum annuum L.*

\*

**GUIDELINES**

**FOR THE CONDUCT OF TESTS**

**FOR DISTINCTNESS, UNIFORMITY AND STABILITY**

*prepared by an expert from Hungary*

*to be considered by the Technical Committee at its forty-first session,  
to be held in Geneva, Switzerland, from April 4 to 6, 2005*

Alternative Names:<sup>\*</sup>

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Capsicum annuum L.</i>	Sweet Pepper, Hot Pepper, Paprika, Chili	Piment, Poivron(s)	Paprika	Aji, Chile, Pimiento

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

**ASSOCIATED DOCUMENTS**

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

\* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website ([www.upov.int](http://www.upov.int)), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Capsicum annuum* L.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

2,500 seeds.

2.4 The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority.

2.5 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.6 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

3.3.1 The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.3.2 The recommended method of observing the characteristic is indicated by the following key in the second column of the Table of Characteristics:

MG: single measurement of a group of plants or parts of plants

MS: measurement of a number of individual plants or parts of plants

VG: visual assessment by a single observation of a group of plants or parts of plants

VS: visual assessment by observation of individual plants or parts of plants

### *3.4 Test Design*

3.4.1 Each test should be designed to result in a total of at least 20 plants which should be divided between 2 replicates.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

### *3.5 Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 20 plants or parts taken from each of 20 plants.

### *3.6 Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

## 4. Assessment of Distinctness, Uniformity and Stability

### *4.1 Distinctness*

#### *4.1.1 General Recommendations*

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

#### *4.1.2 Consistent Differences*

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

#### *4.1.3 Clear Differences*

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the

recommendations contained in the General Introduction prior to making decisions regarding distinctness.

#### 4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity of open pollinated varieties, a population standard of 2% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 20 plants, 2 off-types are allowed.

4.2.3 For the assessment of uniformity of F1 hybrids, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 20 plants, 1 off-type is allowed.

#### 4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

### 5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Seedling: anthocyanin coloration of hypocotyl (characteristic 1)
- (b) Plant: shortened internode (in upper part) (characteristic 4)
- (c) Fruit: color before maturity (characteristic 21)
- (d) Fruit: predominant shape of longitudinal section (characteristic 28)
- (e) Fruit: color after first color change (characteristic 32)
- (f) Fruit: capsaicin in placenta (characteristic 44)
- (g) Resistance to Tobamovirus - Pathotype 0 (Tobacco Mozaic Virus (0)) (characteristic 47.1)

- (h) Resistance to Tobamovirus - Pathotype 1-2 (Pepper Mild Mottle Virus (1-2)) (characteristic 47.3)
- (j) Resistance to Tobamovirus - Pathotype 1-2-3 (Pepper Mild Mottle Virus (1-2-3)) (characteristic 47.4)
- (k) Resistance to Potato Virus Y (PVY) - Pathotype 0 (characteristic 48.1)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

## 6. Introduction to the Table of Characteristics

### 6.1 *Categories of Characteristics*

#### 6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

#### 6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by \*) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

### 6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

### 6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

### 6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 *Legend*

(\*) Asterisked characteristic – see Chapter 6.1.2

QL: Qualitative characteristic – see Chapter 6.3

QN: Quantitative characteristic – see Chapter 6.3

PQ: Pseudo-qualitative characteristic – see Chapter 6.3

(+) See Explanations on the Table of Characteristics in Chapter 8.

MG: single measurement of a group of plants or parts of plants - see Chapter 3.3.2

MS: measurement of a number of individual plants or parts of plants - see Chapter 3.3.2

VG: visual assessment by a single observation of a group of plants or parts of plants - see Chapter 3.3.2

VS: visual assessment by observation of individual plants or parts of plants - see Chapter 3.3.2

## 8. Explanations on the Table of Characteristics

Ads. 4 and 5: Plant: shortened internode (in upper part) (4), Varieties with shortened internodes only: Plants: number of internodes between the first flower and shortened internodes (test to be done on non-pruned plants) (5)

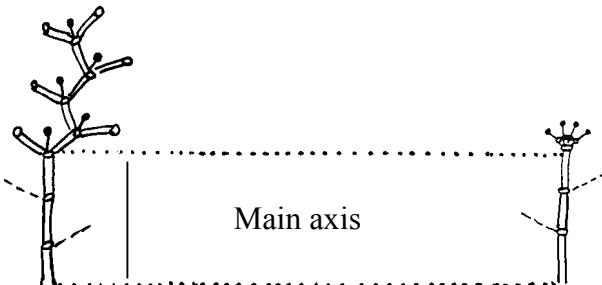

The shoot system of pepper consists of main stems, which are branched off from the main axis and side shoots. Two growth types of the main stems can be distinguished:

Growth type A: the main stems grow indeterminately; one or two flowers develop per node and shortened internodes never develop.

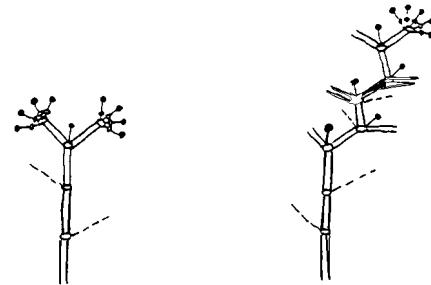

Growth type B: After the first branching of the main axis, shorter internodes appear and the growth of the main stem ends in a bunch of flowers (it appears as if there are more than two flowers per node).

Side shoots develop from the nodes on the main axis and on the main stems.

Growth type A

Growth type B

● Flower

1.

3.

○ Node

none

one to three

more than three

|| Main stem

|| Side shoots

Number of internodes between the first flower and shortened internodes

Ad. 8: Stem : hairiness

To be observed on flowering nodes.

Ad. 9: Plant: height (at maturity)

To be observed after a good fruit setting on several nodes. Poor fruit set may influence the vigor and thus the height of the plant.

Ad. 14: Leaf: shape

1  
lanceolate

2  
ovate

3  
cordate

Ad. 17: Leaf: profile in cross section

3  
flat

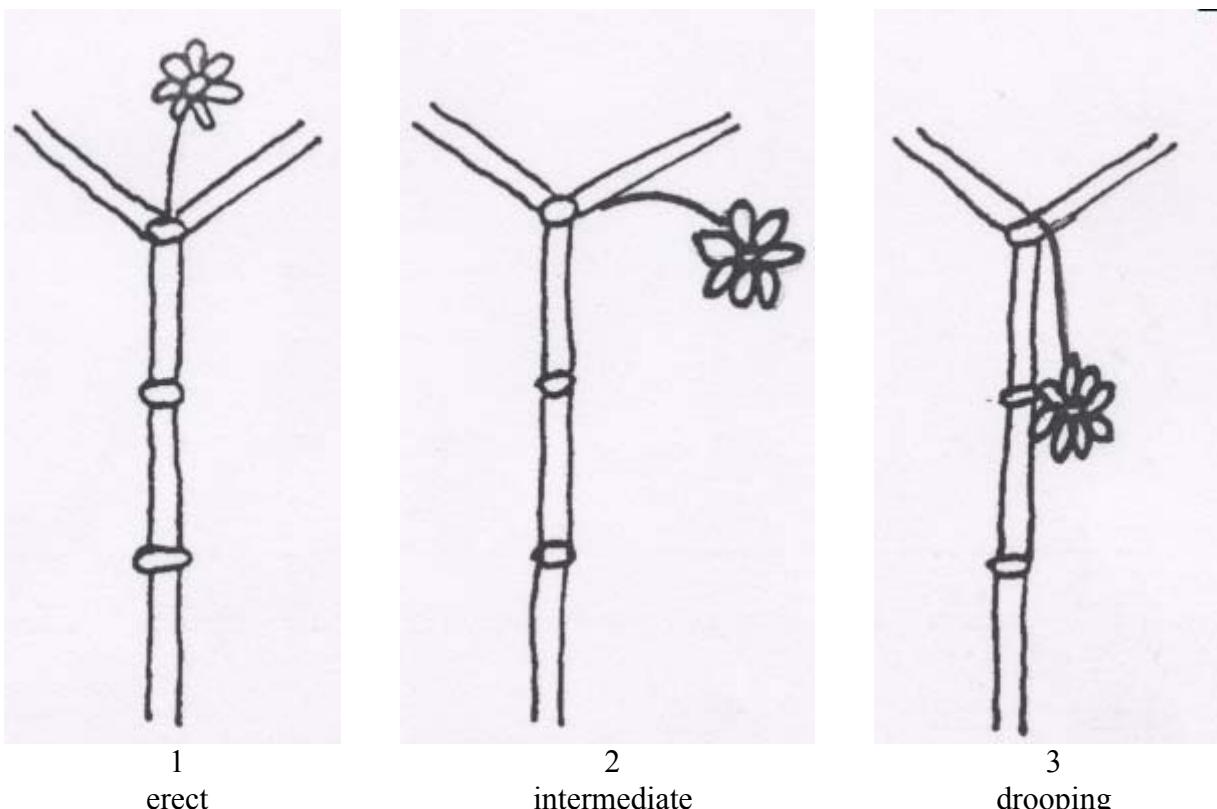

5  
moderately curved

7  
moderately curved

Ad. 19: Flower: attitude of peduncle

Ad. 21: Fruit: color before maturity

The maturity of pepper is reached at the moment of first color change.

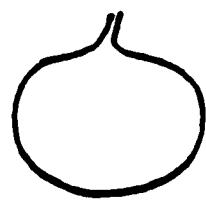

Ad. 27: Fruit: ratio length/diameter

- 1 < 0.5
- 3 0.65 - 0.8
- 5 0.94 - 1.25
- 7 1.75 - 2.75
- 9 >4

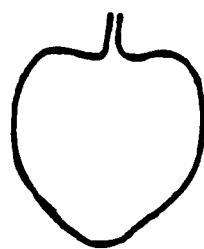

Ad. 28: Fruit: predominant shape of longitudinal section

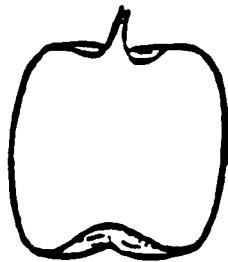

1  
flat

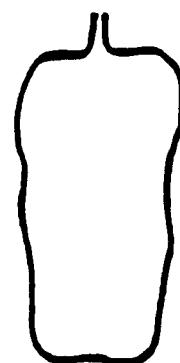

2  
round

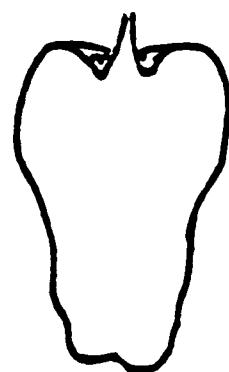

3  
heart-shaped

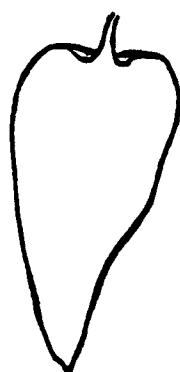

4  
square

5  
rectangular

6  
trapezoid

7  
triangular

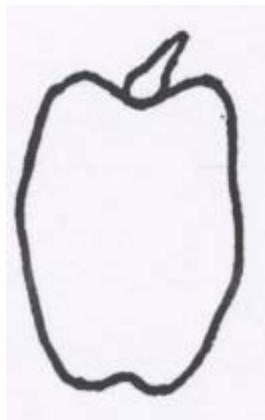

8  
narrow triangular

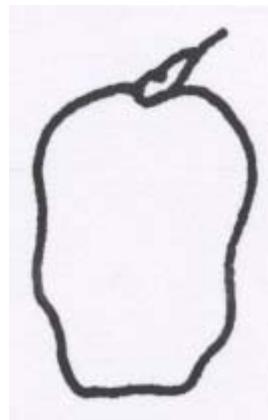

9  
horn-shaped

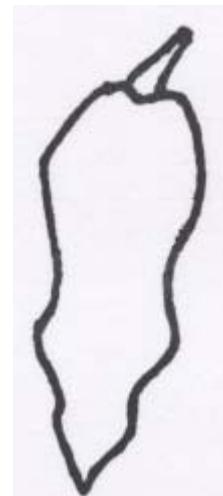

Ad. 30: Fruit: sinuation of pericarp

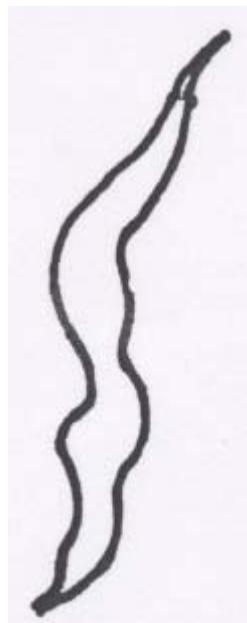

1  
absent or very weak

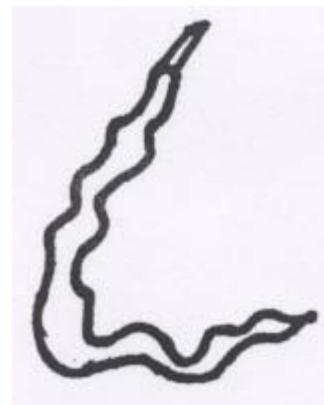

3  
weak

5  
medium

7  
strong

9  
very strong

Ad. 38: Fruit: depth of inter loculary grooves

To be observed in the middle part of the fruit.

Ad. 43: Calyx: aspect

1

non enveloping

2

enveloping

Ads. 47.1 to 47.4: Resistance to Tobamovirus

Maintenance of pathotypes

Type of medium: On plants or dehydrated leaves (in deep-freezer or method BOS)  
Special conditions: Regeneration of the virus on plant material before inoculum preparation

Execution of test

Growth stage of plants When cotyledons are fully developed or at “first leaf” stage  
Temperature: 20-25°C  
Growing method: Sowing and raising of seedlings in boxes or soil blocks in glasshouse  
Method of inoculation: Rubbing of cotyledons with a virus suspension.

Duration of test

- Sowing to inoculation: 10 to 15 days  
- Inoculation to reading: 10 days

Number of plants tested: 15 to 30 plants

Remarks Avoid the test performance at high temperatures or using too far developed plants (risk of necrosis).

Genetics of virus pathotypes and resistant genotypes:

The genetic resistance to Tobamoviruses is controlled by 5 alleles located on the same locus. The table below shows the relationship between virus pathotypes and resistance genotypes:

Pepper Genotype reactions to Tobamovirus Pathotypes

Pepper Tobamovirus Pathotypes					
Pepper Genotypes	Pepper Viruses:	P <sub>0</sub> TMV, ToMV, BePMV, TMGMV, DYFV	P <sub>1</sub> ToMV, TMGMV	P <sub>1-2</sub> ToMV, PMMV	P <sub>1-2-3</sub> PMMV
L-L-		S	S	S	S
L <sup>1</sup> L <sup>1</sup>		R	S	S	S
L <sup>2</sup> L <sup>2</sup>		R	R	S	S
L <sup>3</sup> L <sup>3</sup>		R	R	R	S
L <sup>4</sup> L <sup>4</sup>		R	R	R	R

Legend:      S = not resistant  
                  R = resistant

TMV = Tobacco Mosaic Virus  
ToMV = Tomato Mosaic Virus  
BePMV = Bell Pepper Mosaic Virus  
TMGMV = Tobacco Mild Green Mosaic Virus  
DYFV = Dulcamara Yellow Fleck Virus  
PMMV = Pepper Mild Mottle Virus

#### Ad. 48: Resistance to Potato Virus Y (PVY)

##### Maintenance of pathotypes

Type of medium: On susceptible plants.

Special conditions: For the common strain PVY(0): use the line T072(A)  
For the evolved strain PVY(1): use the line Sicile 15  
For the evolved strain PVY(1-2): use the line SON41

##### Execution of test

Growth stage of plants: Young plants at the stage of developed cotyledons - first pointing leaf.

Temperature: 18-25°C

Growing method: Raising of plants in glasshouse.

Method of inoculation: Rubbing of cotyledons with a virus solution.

Composition of the solution:

inoculum: 4 ml extraction solution for 1 g infected leaves + 80 g activated carbon + 80 mg carborundum;

extraction solution: buffer solution diluted 1/20 + 0.2% diethyl dithiocaremate of sodium (DIECA);

buffer solution: (for 100 ml sterile water) 10.8 g Na<sub>2</sub>HPO<sub>4</sub> + 1.18 g K<sub>2</sub>HPO<sub>4</sub> at pH 7.1-7.2

##### Duration of test

- Sowing to inoculation: 10 to 15 days  
- Inoculation to reading: 3 weeks (2 weeks minimum, 4 weeks maximum)

Number of plants tested: 60 plants

Remarks: Avoid the carrying out of the test at high temperatures.

Standard varieties:	Pathotype 0	Pathotype 1	Pathotype 1-2
Sensitive varieties:	Yolo Wonder	Yolo Wonder, Yolo Y	Florida VR2,* Yolo Wonder, Yolo Y
Resistant varieties:	Yolo Y	Florida VR2	Criollo de Morenos, Serrano

\* Florida VR2 can examine diffused and very late symptoms.

Ad. 49: Resistance to *Phytophthora capsici*

Maintenance of inoculum

Type of medium: Phytophthora capsici isolate S 101 cultivated on agar (1%) V8 in Petri dish.

Preparation of inoculum

The inoculum is prepared from 4 mycelial plugs of 4 mm diameter cultured in Petri dishes.

Conduct of test

Growth stage of plants: When cotyledons are fully developed.

Temperature: 22°C

Light: 12h/day

Growing method: In climatic chamber in a mixture of peat and sand (1/1 by vol.).

Method of inoculation: The young plants should be carefully uprooted and the roots washed in water. Then the plants should be regrouped in samples of 10 plants and placed in a liquid growth medium (Knop diluted twice) or a nutrient solution. After one week of culture in liquid medium the plants should be inoculated by the introduction of 4 mycelial plugs into the liquid growth medium. The inoculation takes place through the infection of the roots by the free zoospores. The mycelial plugs are kept in this environment until reading.

Duration of test

From sowing to inoculation: 21 days

From inoculation to first reading: 7 days

Lay-out of test: 40 plants, in 4 replicates of 10 plants

Standard varieties:

After one week the plants should be individually observed and a note from 1 to 5 attributed to each plant depending on the degree of necrosis of the root system. The level of resistance of a variety is expressed by a figure calculated as the average of 40 plants:

After inoculation by isolate S 101, for example:

Yolo Wonder = 5  
Phyo 636 = 2.5  
Picador, PM 217 = 0.5

Varieties which have received a figure 3 or higher than 3 should be regarded as non-resistant.

#### Ad. 50: Resistance to Cucumber Mosaic Virus (CMV)

##### Maintenance of pathotypes

Strain: Fulton

Type of medium: On susceptible plants: *Vinca rosea*

Special conditions: -

Inoculum production: Crushing of 1g of fresh leaves of *Vinca rosea* in 4 ml of Phosphate buffer 0.03M pH 7 + DIECA (diethyl dithiocaremate de sodium) (1 for 1000) + 300 mg of activated carbon + 80 mg of carborundum

##### Execution of test:

Growth stage of plants: Young plants at the stage of developed cotyledons. First leaf non pointing

Number of plants: 50 plants

Growing conditions: 22°C, 12 hours of light

Growing method: Raising of plants in climatised room

Method of inoculation: Mechanical rubbing of cotyledons with a virus solution, the plants are kept in darkness for 48 hours

##### Duration of test:

From sowing to inoculation: 12 to 13 days

From inoculation to reading: 3 reading at 10,15 and 21 days after inoculation

##### Standard varieties:

Susceptible variety: Yolo Wonder

Tolerant (T) or resistant (R) varieties: Milord (T)  
Vania (R)

Ruffel, S., Dussault, M.H., Palloix, A., Moury, B., Bendahmane, A., Robaglia, C., Caranta, C., 2002: “A natural recessive resistance gene against potato virus Y in pepper corresponds to the eukariotic initiation factor 4E (eIF4E)”, Plant Journal, GB, vol. 32 no. 6; 1067-1075

### NEMATODE

Djian-Caporalino, C., Pijarowski, L., Januel, A., Lefebvre, V., Caranta, C., Chauvet, J.C., Blattes, A., Palloix, A., Dalmasso, A., Abad, P., 1998: “Characterising and fine mapping of the Me3 gene conferring heat-stable resistance to root-knot nematodes (*Meloidogyne* spp.) in pepper (*Capsicum annuum* L.) using AFLPs”, EUCARPIA, European Association for Research on Plant Breeding, FR, 10th Meeting on Genetics and Breeding of Capsicum and Eggplant, Avignon, FR, 1998/09/07-11, 125-128, EUCARPIA, Paris, FR

Djian-Caporalino, C., Pijarowski, L., Januel, A., Palloix, A., Lefebvre, V., Phally, T., 1996: “Identification of DNA markers linked to the Me3 gene controlling resistance to root-knot nematodes in pepper (*Capsicum annuum L.*)”, 3<sup>rd</sup> International Nematology Congress, Gosier (GP), 1996/07/07-12, 149, Society of Nematologists, US

#### CMV

Caranta, C., Daubèze, A.M., Pflieger, S., Lefebvre, V., Thabuis, A., Blattes, A., Nemouchi, G., Phaly, T., Signoret, P., Palloix, A., 2001: “Identification of quantitative trait loci involved in partial restriction of cucumber mosaic virus (CMV) long-distance movement in pepper”, EUCARPIA, European Association for Research on Plant Breeding, Paris (FRA), Genetics and breeding of Capsicum and eggplant, 11th EUCARPIA Meeting, Antalya, TR, 2001 176-180

Caranta, C., Palloix, A., Lefebvre, V., Daubèze, A.M., 1997: “QTLs for a component of partial resistance to cucumber mosaic virus in pepper : restriction of virus installation in host-cells”, Theoretical and Applied Genetics, DE, no. 94; 431-438

Caranta, C., Pflieger, S., Lefebvre, V., Daubèze, A.M., Thabuis, A., Palloix, A., 2002: “QTLs involved in the restriction of cucumber mosaic virus (CMV) long-distance movement in pepper”, Theoretical and Applied Genetics, DE, vol. 104; 586-591

#### PHYTOPHTORA

Lefèvre, V., Palloix, A., 1995: “Mapping QTL's affecting the resistance to Phytophthora capsici in pepper (*Capsicum annuum*)”, Scherago International Inc., New York, US, USDA, United States Department of Agriculture, Agricultural Research Service, Washington, US, International Conference on the Status of Plant Genome Research, Plant Genome 3, San Diego, US, 1995/01/15-19 58, USDA-ARS, Washington, US

Lefebvre, V., Palloix, A., 1996: “Both epistatic and additive effects of QTLs are involved in polygenic induced resistance to disease : a case study, the interaction pepper Phytophthora capsici Leonian”, Theoretical and Applied Genetics, DE, no. 93; 503-511

Thabuis, A., Palloix, A., Pflieger, S., Daubèze, A.M., Caranta, C., Lefebvre, V., 2003: “Comparative mapping of Phytophthora resistance loci in pepper germplasm: evidence for conserved resistance loci across Solanaceae and for a large genetic diversity”, Theoretical and Applied Genetics, DE, vol. 106; 1473-1485

#### TSWV

Moury, B., Pflieger, S., Blattes, A., Lefebvre, V., Palloix, A., 2000: “A CAPS marker to assist selection of tomato spotted wilt virus (TSWV) resistance in pepper”, Genome, CA, no. 43; 137-142

#### POWDERY MILDEW

Lefebvre, V., Daubèze, A.M., Rouppe van der Voort, J., Peleman, J., Bardin, M., Palloix, A., 2003: “QTLs for resistance to powdery mildew in pepper under natural and artificial infections”, Theoretical and Applied Genetics, DE, vol. 107 no. 4; 661-666

10. Technical Questionnaire

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
		Application date: (not to be filled in by the applicant)
TECHNICAL QUESTIONNAIRE to be completed in connection with an application for plant breeders' rights		
1. Subject of the Technical Questionnaire		
1.1 Botanical name	<i>Capsicum annuum</i> L	
1.2 Common Name	Sweet Pepper, Hot Pepper, Paprika, Chili	
2. Applicant		
Name		
Address		
Telephone No.		
Fax No.		
E-mail address		
Breeder (if different from applicant)		
3. Proposed denomination and breeder's reference		
Proposed denomination (if available)		
Breeder's reference		

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
<p>#4. Information on the breeding scheme and propagation of the variety</p> <p>4.1 Breeding scheme</p> <p>Variety resulting from:</p> <p>4.1.1 Crossing [ ]</p> <p>(a) controlled cross (please state parent varieties) [ ]</p> <p>(b) partially known cross (please state known parent variety(ies)) [ ]</p> <p>(c) unknown cross [ ]</p> <p>4.1.2 Mutation [ ] (please state parent variety)</p> <p>4.1.3 Discovery and development [ ] (please state where and when discovered and how developed)</p> <p>4.1.4 Other [ ] (please provide details)</p> <p>4.2 Method of propagating the variety</p> <p>4.2.1 Seed-propagated varieties</p> <p>(a) Self-pollination [ ]</p> <p>(b) Cross-pollination [ ]</p> <p>(c) Hybrid [ ]</p> <p>(d) Other [ ] (please provide details)</p> <p>4.2.2 Other [ ] (please provide details)</p>		

# Authorities may allow certain of this information to be provided in a confidential section of the Technical Questionnaire.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
5. Characteristics of the variety to be indicated (the number in brackets refers to the corresponding characteristic in Test Guidelines; please mark the note which best corresponds).		
Characteristics	Example Varieties	Note
<b>5.1 Plant: shortened internode (in upper part)</b> <b>(4)</b>		
absent	California Wonder, De Cayenne	1[ ]
present	Fehér, Kalocsai 601	9[ ]
<b>5.2 Flower: attitude of peduncle</b> <b>(19)</b>		
erect	Fehér, Red Chili	1[ ]
intermediate	Blondy	2[ ]
drooping	Heldor, Lamuyo	3[ ]
<b>5.3 Fruit: color <u>before</u> maturity</b> <b>(21)</b>		
greenish white	Blanc d'Espagne, Twiggy	1[ ]
yellowish	Fehér, Sweet Banana	2[ ]
green	California Wonder, Lamuyo	3[ ]
purple	Violetta	4[ ]
<b>5.4 Fruit: intensity of color <u>before</u> maturity</b> <b>(22)</b>		
very light	Kaméleon, Jackson, Milka, Sofiane, Savó	1[ ]
light	Anthea, Daras, PCR	3[ ]
medium	Demon, PAZ szentesi	5[ ]
dark	California wonder, Greygo	7[ ]
very dark	Amato, Hot chilli, Kalocsai A, Olimpo	9[ ]

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
Characteristics	Example Varieties	Note
<b>5.5 Fruit: predominant shape of longitudinal section (28)</b>		
flat	Liebesapfel, PAZ szentesi, Topepo rosso	1[ ]
round	Cherry Sweet	2[ ]
heart-shaped	Daniel, Pimiento L.	3[ ]
square	Delphin, Yolo Wonder	4[ ]
rectangular	Clovis, Nocera rosso	5[ ]
trapezoid	Piperade, Delta	6[ ]
triangular	Marconi, Fehér	7[ ]
narrow triangular	Demon, De Cayenne	8[ ]
horn-shaped	Corno di toro rosso, Lipari	9[ ]
<b>5.6 Fruit: color after first color change (32)</b>		
yellow	Golden Calwonder, Heldor	1[ ]
orange	Ariane	2[ ]
red	Fehér, Lamuyo	3[ ]
brown	Brupa, Negral	4[ ]
<b>5.7 Fruit: predominant number of locules (39)</b>		
only two	De Cayenne	1[ ]
two and three	Fehér	2[ ]
three	Century	3[ ]
three and four	Lamuyo, Sonar	4[ ]
four and more	Palio, PAZ szentesi	5[ ]

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
Characteristics	Example Varieties	Note
<b>5.8 Fruit: capsaicin in placenta (44)</b>		
absent	Sonar	1[ ]
present	De Cayenne	9[ ]
<b>5.9(i) Resistance to Tobamovirus - (47.1) Pathotype 0 (Tobacco Mozaic Virus (0))</b>		
absent	Doux italien, Piperade	1[ ]
present	Lamuyo, Sonar, Yolo Wonder	9[ ]
<b>5.9(ii) Resistance to Tobamovirus - (47.2) Pathotype 1 (Pepper Mild Mottle Virus (1))</b>		
absent	Piperade, Yolo Wonder	1[ ]
present	‘Tabasco’ (C. frutescens)	9[ ]
<b>5.9(iii) Resistance to Tobamovirus - (47.3) Pathotype 1-2 (Pepper Mild Mottle Virus (1-2))</b>		
absent	Piperade, Yolo Wonder	1[ ]
present	Delgado, Festos, Novi, Orion	9[ ]
<b>5.9(iv) Resistance to Tobamovirus - (47.4) Pathotype 1-2-3 (Pepper Mild Mottle Virus (1-2-3))</b>		
absent	Piperade, Yolo Wonder	1[ ]
present	Cuby, Tasty	9[ ]

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- |   |         |        |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma)    | Yes [ ] | No [ ] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [ ] | No [ ] |
| (c) Tissue culture  | Yes [ ] | No [ ] |
| (d) Other factors   | Yes [ ] | No [ ] |

Please provide details of where you have indicated "yes".

.....  
9.3 Has the plant material to be examined been tested for the presence of virus or other pathogens?

Yes [ ]

(please provide details as specified by the Authority)

No [ ]

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:

Applicant's name [ ]  
Signature [ ] Date [ ]
