INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS

Geneva

DRAFT

SORGHUM

UPOV Code: SRGHM

Sorghum bicolor
Sorghum xdrummondii

GUIDELINES

FOR THE CONDUCT OF TESTS

FOR DISTINCTNESS, UNIFORMITY AND STABILITY

prepared by experts from Spain

to be considered by the

*Technical Working Party for Agricultural Crops
at its forty-third session, to be held in Mar del Plata, Argentina, from November 17 to 21, 2014*

Alternative Names:^{*}

Botanical name	English	French	German	Spanish
<i>Sorghum bicolor</i>	Sorghum,	Sorgho,	Mohrenhirse,	Sorgo,
<i>Sorghum xdrummondii</i>	Sudan Grass	Sorgho du Soudan	Sudangrass	Pasto de Sudán

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

ANNEX COMMENTS BY THE SUBGROUP

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Sorghum bicolor* and *Sorghum xdrummondii* (Steud.) Miklsp. & Chase

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

0.2 kg for parental components
1 kg for hybrids and open-pollinated varieties.

The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. In cases where the seed is to be stored, the germination capacity should be as high as possible and should, be stated by the applicant.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

3.3.1 The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.3.2 The optimum stage of development for the assessment of each characteristic is indicated by a number in the second column of the Table of Characteristics. The stages of development denoted by each number are described in Chapter 8.3.

3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 40 plants in the case of inbred lines and single hybrids and 60 plants in the case of other hybrids and open-pollinated varieties. Each test should be divided between at least 2 replicates.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 Additional Tests

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 Distinctness

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

To assess distinctness of hybrids, a pre-screening system on the basis of the parental lines and the formula may be established according to the following recommendations:

- (i) description of parental lines according to the Test Guidelines;
- (ii) check of the originality of the parental lines in comparison with the reference collection, based on the characteristics in Section 7 in order to screen the closest parental lines;
- (iii) check of the originality of the hybrid formula in comparison with those of the hybrids in common knowledge, taking into account the closest parental lines;
- (iv) assessment of the distinctness at the hybrid level of varieties with a similar formula.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.1.4 Number of Plants / Parts of Plants to be Examined

4.1.4.1 Inbred lines and single hybrids: All observations on single plants (MS) should be made on 10 plants or parts taken from each of 10 plants and all other observations made on all plants in the test.

4.1.4.2 Other types of hybrids: All observations on single plants (MS) should be made on 20 plants or parts taken from each of 20 plants and all other observations made on all plants in the test.

4.1.4.3 Open-pollinated varieties: All observations on single plants (MS) should be made on 40 plants or parts taken from each of 40 plants and all other observations made on all plants in the test.

4.1.5 Method of Observation

The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the second column of the Table of Characteristics (see document TGP/9 "Examining Distinctness", Section 4 "Observation of characteristics"):

- MG: single measurement of a group of plants or parts of plants
MS: measurement of a number of individual plants or parts of plants
VG: visual assessment by a single observation of a group of plants or parts of plants
VS: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)

“Visual” observation (V) is an observation made on the basis of the expert’s judgment. For the purposes of this document, “visual” observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. color charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)

For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, “G” provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 For the assessment of uniformity of inbred lines and single hybrids, a population standard of 3% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 40 plants, 3 off-types are allowed. In addition, the same population standard and acceptance probability should apply to clear cases of out-crossed plants in inbred lines as well as plants obviously resulting from the selfing of a parent line in single-cross hybrids

4.2.3 For three-way cross hybrids, double cross hybrids and open-pollinated varieties, the variability within the variety should not exceed the variability of comparable varieties already known.

4.2.4 The assessment of uniformity for open-pollinated varieties should be according to the recommendations for cross-pollinated varieties in the General introduction.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability of parental lines or open-pollinated varieties may be tested, either by growing a further generation, or by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

4.3.3 Where appropriate, or in cases of doubt, the stability of a hybrid variety may, in addition to an examination of the hybrid variety itself, also be assessed by examination of the uniformity and stability of its parent lines.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Plant: time of panicle emergence (characteristic 7)
- (b) Plant: length (characteristic 18)
- (c) Panicle: position of broadest part (characteristic 26)
- (d) Grain: color after threshing (characteristic 29)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction and document TGP/9 "Examining Distinctness".

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

6.2.1 States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.2.2 In the case of qualitative and pseudo-qualitative characteristics (see Chapter 6.3), all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

State	Note
small	3
medium	5
large	7

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

State	Note
very small	1
very small to small	2
small	3
small to medium	4
medium	5
medium to large	6
large	7
large to very large	8
very large	9

6.2.3 Further explanation of the presentation of states of expression and notes is provided in document TGP/7 "Development of Test Guidelines".

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 *Legend*

(*) Asterisked characteristic – see Chapter 6.1.2

QL Qualitative characteristic – see Chapter 6.3

QN Quantitative characteristic – see Chapter 6.3

PQ Pseudo-qualitative characteristic – see Chapter 6.3

MG, MS, VG, VS – see Chapter 4.1.5

(a)-(c) See Explanations on the Table of Characteristics in Chapter 8.1

(+) See Explanations on the Table of Characteristics in Chapter 8.2

12-93 See Explanations on the Table of Characteristics in Chapter 8.3 (Decimal Code for the Growth Stages)

8. Explanations on the Table of Characteristics

8.1 Explanations covering several characteristics

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- (a) The observation should be made on the third leaf from the top of the plant excluding flag leaf.
- (b) The observation should be made in the middle third of the main panicle.
- (c) The observation should be made just above the third leaf from the top of the plant excluding flag leaf.

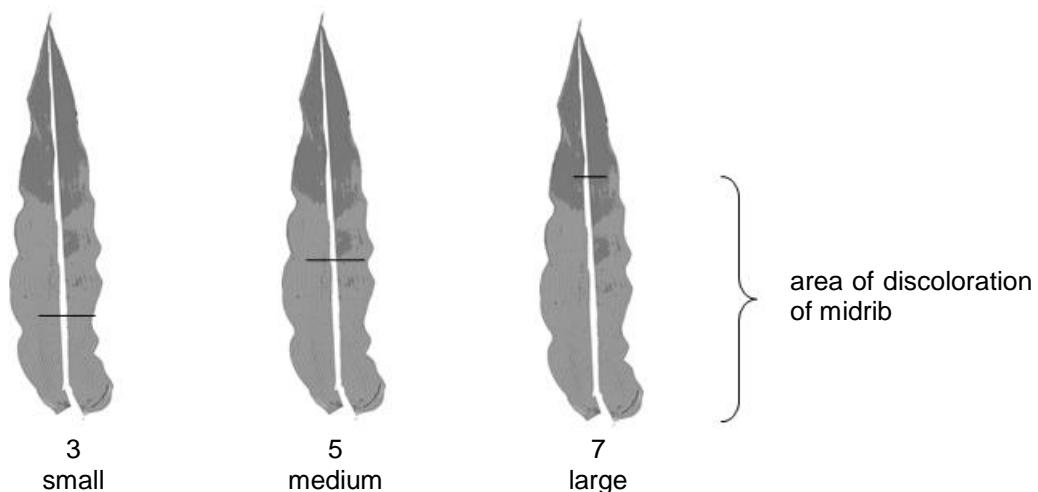

8.2 Explanations for individual characteristics

Ad. 2: Leaf: anthocyanin coloration of blade

The observation should be made on the third leaf from the bottom.

Ad. 6: Leaf: area of discoloration of midrib

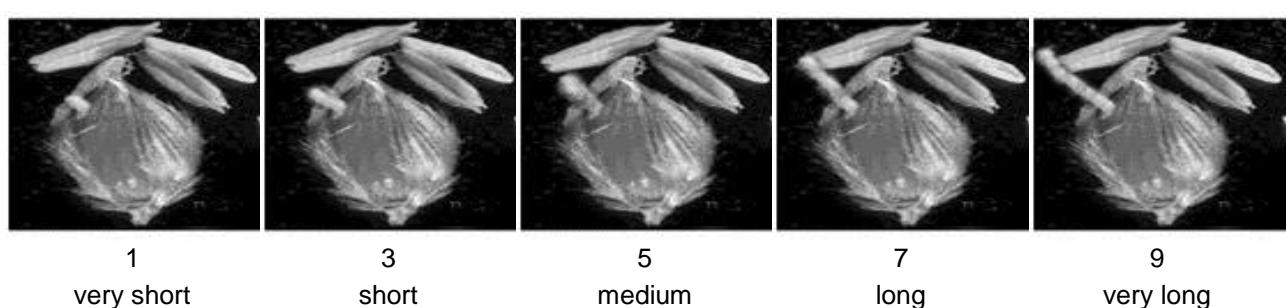

Ad. 7: Plant: time of panicle emergence

The time of panicle emergence is when the tip of the panicle has emerged from flag leaf sheath on 50% of the plants.

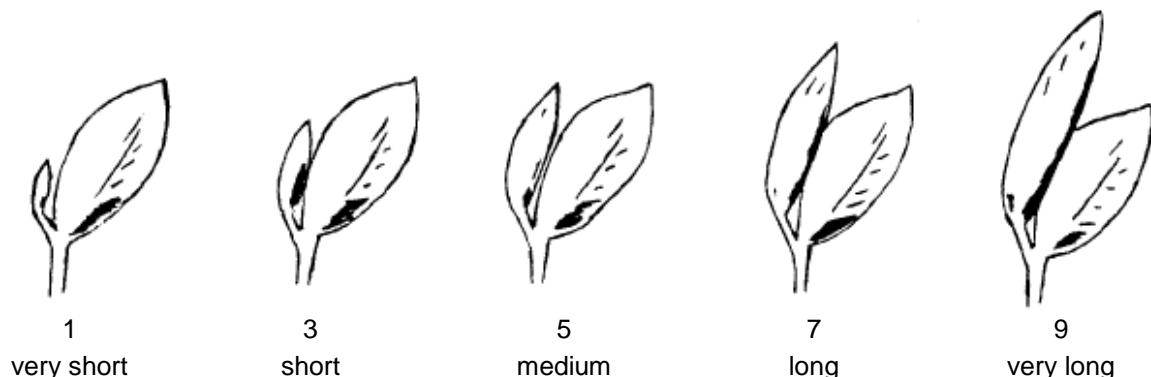

Ad. 10: Stigma: color

Impossibility to observe in case of strong anthocyanin coloration.

Ad. 11: Stigma: length

Ad. 12: Flower with pedicel: length of flower

Ad. 13: Flower: self-fertility

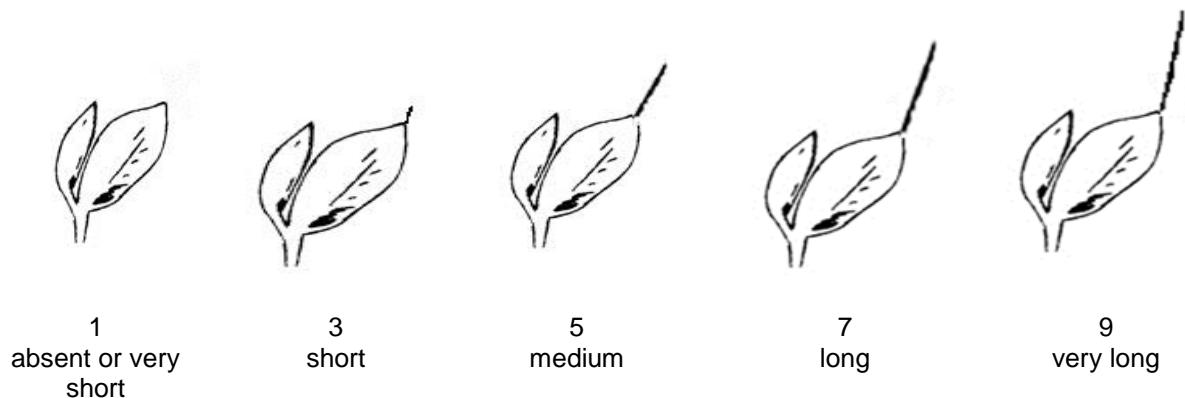

To be observed on 10 plants.

The heads are bagged with kraft bags before flowering. After maturity the bag is removed from each head, the estimated seed set in percentage of total number of florets is recorded.

Panicle: self-fertility

- | | |
|---|------------------------------|
| 1 | absent or very low: 0% - 10% |
| 2 | medium: 11% - 70% |
| 3 | high: 71% - 100% |

Ad. 16: Lemma: length of arista

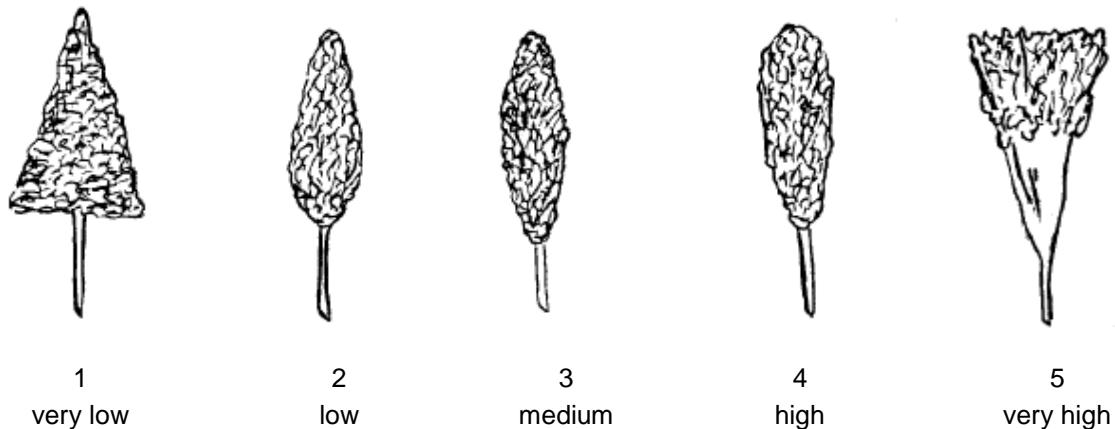

Ad. 22: Panicle: length

The assessment must be done without the neck.

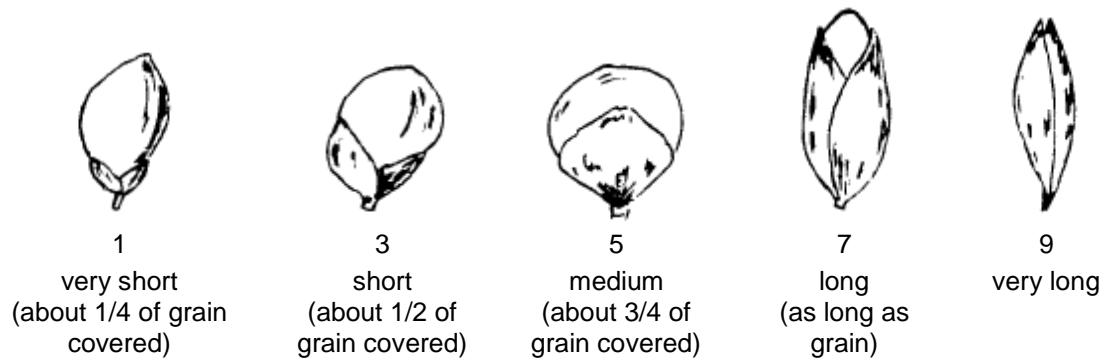

Ad. 23: Panicle: length of neck

The neck is between flag leaf and first ramification of panicle.

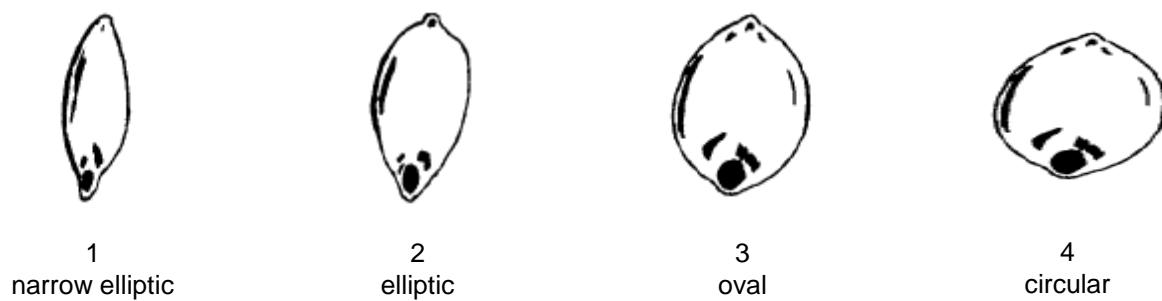

Ad. 26: Panicle: position of broadest part

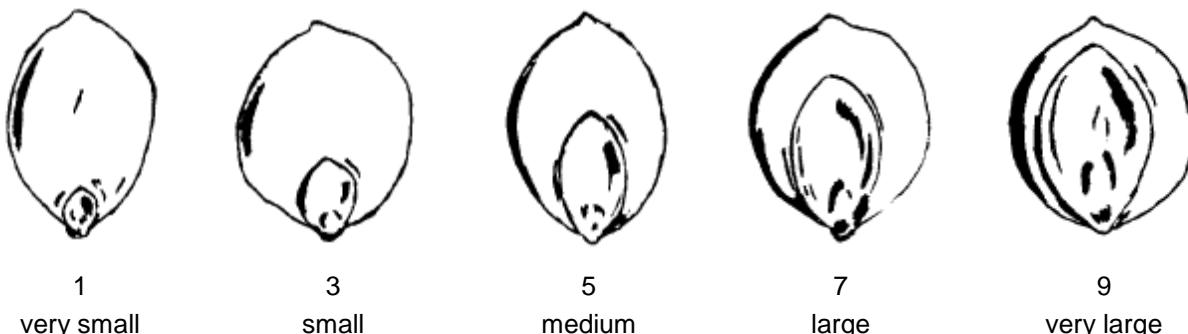

Ad. 28: Glume: length

Ad. 31: Grain: shape in dorsal view

Ad. 32: Grain: size of mark of germ

Ad. 33: Grain: content of tannin

METHOD DETECTION OF TANNIN IN SORGHUM GRAIN BY THE BLEACH TEST (see reference in Chapter 9)

1. Scope

Applicable to whole grain sorghum

2. Definitions

Certain varieties of sorghum contain proanthocyanidins (commonly referred to as tannins or more strictly-speaking condensed tannins) in the seed coat layer beneath the pericarp (commonly referred to as the testa layer) of the grain. These varieties are variously referred to as: tannin, high-tannin, brown, bird-proof, bird-resistant, or bitter sorghums.

Varieties of sorghum not containing tannins are various referred to as: non-tannin, lowtannin, condensed tannin-free, or sweet sorghums.

In this Test Guidelines the term "tannin sorghum" shall be used for those sorghums containing tannins and the term "non-tannin sorghum" used for those sorghums not containing tannins.

3. Principle

Sorghum grain is immersed in a sodium hypochlorite solution (bleach) containing alkali. The solution dissolves away the outer pericarp layer of sorghum grain, revealing the presence of a black pigmented testa layer in the case of tannin sorghums, or its absence in the case of non-tannin sorghums.

4. Reagent

4.1 Bleaching reagent

Five g sodium hydroxide is dissolved in 100 ml of 3.5% sodium hypochlorite solution (commercial bleach). Reagent can be stored at room temperature in light-proof bottle for up to one month.

4.2 Sorghum standards

An appropriate tannin and non-tannin standard.

5. Apparatus

Glass beakers (50 ml)

Tea strainer

Aluminum foil

Paper towel

6. Procedure

6.1 Test must be performed in duplicate.

6.2 Known tannin sorghum and non-tannin sorghum standards must be included each time the test is performed.

6.3 One hundred whole, sound sorghum grains are placed in a beaker.

6.4 Bleaching reagent is added to **just** cover the sorghum grains and close beaker with aluminum foil. Too much bleaching reagent will cause over bleaching and give false negative results. If in doubt repeat using less reagent.

6.5 Incubate beaker at room temperature (20-30°C) for 20 minutes, swirling contents of beaker every 5 minutes.

6.6 Empty contents of beaker into tea strainer, discarding bleaching reagent. Rinse sorghum grains in tea strainer with tap water.

6.7 Empty contents of tea strainer onto sheet of paper towel. Spread grains out into a single layer and gentle blot them dry with another piece of paper towel.

6.8 Count tannin sorghum grains. Tannin sorghum grains are those grains that are **black over the entire surface of the grain**, unless the germ is somewhat lighter in colour. Non-tannin sorghum grains are those which are either completely white, **or** are brown over **part** of the surface of the grain.

7. Presentation of results

7.1 Calculate tannin sorghum grains as percentage of total sorghum grains. Duplicate determinations should not differ by more than +/- 5 grains, for example first determination 90%, second determination 85%, or 95%. The mean of the duplicate determinations should be calculated.

7.2 Expression of results

Results should be expressed as:

Percentage tannin sorghum, e.g. 90% tannin sorghum

8. Recommended standards

It is recommended that: Batches containing \geq 95% tannin or non-tannin sorghum be classified as Tannin or Nontannin Sorghum, respectively.

Where batches contain < 95% tannin (or non-tannin) sorghum and > 5% non-tannin (or tannin) sorghum, the batch be classified as Mixed Tannin and Non-tannin Sorghum and that the percentage tannin sorghum be given.

NOTES

- 1 A 5 ml medicine measuring spoonful may be used to measure out approx. 5 g of sodium hydroxide if a weighing balance is not available
- 2 Commercial caustic soda, sometimes marketed as drain cleaner, may be used
- 3 Measure using for example a 200 ml soft drink bottle (after use wash out with water and then crush bottle before disposal) and use a 2 x 5 ml medicine spoon measuring spoon full of caustic soda.
- 4 Any clear glass or plastic beaker or container with a diameter of around 3 cm.

1
absent or very low

2
medium

3
very high

Conclusions: Grain content of tannin

Number of grains to be observed: 100 grains

1 absent or very low: $\leq 5\%$ tannin

2 medium: $> 5\% - > 95\%$ tannin

3 high: $\geq 95\%$ tannin

Ad. 34: Grain: type of endosperm

The observation should be made on the longitudinal section.

1
fully vitreous

3
 $\frac{3}{4}$ vitreous

5
half vitreous

7
 $\frac{3}{4}$ farinaceous

9
fully farinaceous

Ad. 36: Plant: photoperiod sensitivity

Photoperiod insensitive sorghum will initiate floral development depending only of the amount of light hours per day.

Photoperiod sensitive sorghum will not initiate floral development until the light hours during the day are more or less than 12 hours.

8.3 Decimal Code for the Growth Stages of Cereals

This decimal code is in close conformity with the BBCH-code (Witzenberger et al., 1989; Lancashire et al., 1991)

CODE	GENERAL DESCRIPTION
GERMINATION	
00	Dry seed
01	Beginning of seed inhibition
02	
03	Seed inhibition complete
04	
05	Radicle emerged from caryopsis
06	Radicle elongated, root hairs and /or side roots visible
07	Coleoptile emerged from caryopsis
08	
09	Emergence: coleoptile penetrates soli surface (cracking stage)
LEAF DEVELOPMENT	
10	First leaf through coleoptile
11	First leaf unfolded
12	2 leaves unfolded
13	3 leaves unfolded
14	4 leaves unfolded
15	5 leaves unfolded
16	6 leaves unfolded
17	7 leaves unfolded
18	8 leaves unfolded
19	9 or more leaves unfolded
TILLERING	
20	No tillers
21	Beginning of tillering: first tiller detectable
22	2 tillers detectable
23	3 tillers detectable
24	4 tillers detectable
25	5 tillers detectable
26	6 tillers detectable
27	7 tillers detectable
28	8 tillers detectable
29	End of tillering. Maximum no. of tillers detectable.
STEM ELONGATION	
30	Pseudo stem erection
31	1 st node detectable
32	2 nd node detectable
33	3 rd node detectable
34	4 th node detectable
35	
36	
37	Flag leaf just visible, still rolled
38	
39	Flag leaf stage: flag leaf fully unrolled, ligule just visible
BOOTING	
40	
41	Early boot stage: flag leaf sheath extending
42	
43	Mid boot stage: flag sheath just visibly swollen
44	
45	Late boot stage: flag leaf sheath swollen
46	
47	Flag leaf sheath opening
48	
49	First awns visible (in awned forms only)

INFLORESCENCE EMERGENCE, HEADING

- 50
51 Beginning of heading: tip of inflorescence emerged from sheath, first spikelet just visible
52 20% of inflorescence emerged
53 30% of inflorescence emerged
54 40% of inflorescence emerged
55 50% of inflorescence emerged
56 60% of inflorescence emerged
57 70% of inflorescence emerged
58 80% of inflorescence emerged
59 End of heading: inflorescence fully emerged

FLOWERING, ANTHESIS

- 60
61 Beginning of flowering: first anthers visible
62

- 63
64
65 Full flowering: 50% of anthers mature
66

- 67
68
69 End of flowering: all spikelets have completed flowering but some dehydrated anthers may remain.

DEVELOPMENT OF FRUIT

- 70
71 Watery ripe: first grains have reached half their final size
72
73 Early milk
74
75 Medium milk: grain content milky, grains reached final size, still green
76
77 Late milk
78
79

RIPENING

- 80
81
82
83 Early dough
84
85 Soft dough: grain content soft but dry. Fingernail impression not held.
86
87 Hard dough: grain content solid. Fingernail impression held
88
89 Fully ripe: grain hard, difficult to divide with thumbnail

SENESCENCE

- 90
91
92 Over-ripe: grain very hard cannot be dented by thumbnail
93 Grains loosening in day-time
94
95
96
97 Plant dead and collapsing
98
99 Harvested product

6. Similar varieties and differences from these varieties

Please use the following table and box for comments to provide information on how your candidate variety differs from the variety (or varieties) which, to the best of your knowledge, is (or are) most similar. This information may help the examination authority to conduct its examination of distinctness in a more efficient way.

Denomination(s) of variety(ies) similar to your candidate variety	Characteristic(s) in which your candidate variety differs from the similar variety(ies)	Describe the expression of the characteristic(s) for the similar variety(ies)	Describe the expression of the characteristic(s) for your candidate variety
<i>Example</i>	<i>Plant: time of panicle emergence</i>	<i>early</i>	<i>early to medium</i>
Comments:			

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
<p>#7. Additional information which may help in the examination of the variety</p> <p>7.1 In addition to the information provided in sections 5 and 6, are there any additional characteristics which may help to distinguish the variety?</p> <p>Yes [] No []</p> <p>(If yes, please provide details)</p> <p>7.2 Are there any special conditions for growing the variety or conducting the examination?</p> <p>Yes [] No []</p> <p>(If yes, please provide details)</p> <p>7.3 Other information</p>		
<p>8. Authorization for release</p> <p>(a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?</p> <p>Yes [] No []</p> <p>(b) Has such authorization been obtained?</p> <p>Yes [] No []</p> <p>If the answer to (b) is yes, please attach a copy of the authorization.</p>		

Authorities may allow certain of this information to be provided in a confidential section of the Technical Questionnaire.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes [] | No [] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [] | No [] |
| (c) Tissue culture | Yes [] | No [] |
| (d) Other factors | Yes [] | No [] |

Please provide details for where you have indicated "yes".

.....

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:

ANNEX

COMMENTS BY THE SUBGROUP

ITEM	COMMENTS
Front page	<p>France Alternative Name: To delete "Sorgho du Soudan"</p>
2.3	<p>Hungary We would appreciate a higher amount of seed sample of parental components (0.5 kg as a minimum), as there is not so much difference in the TSW of inbred lines, hybrids and open pollinated varieties.</p>
Char. 3 Plant: number of tillers	<p>France MS/MG/VG. May be measured, or even observed, on a group of plants.</p> <p>We wonder if 9 states of expression are necessary, and its consequences on the assessment of uniformity. We would be in for of 5 states instead of 9.</p> <p>Hungary An explanation in Chapter 8.2 should be welcomed concerning this characteristic.</p> <p>Germany To explain whether there is a minimum height necessary to be counted as a tiller (e.g. one third of height of plant) in order to avoid counting of rudimentary tillers</p> <p>Kenya NB. It will be good to state that tillering data should not be collected on plants whose apical bud has been damaged by pests at early growth, since tillering is enhanced in such situations.</p>
Char. 6 Plant: time of panicle emergence	<p>China We suggest to use MG only.</p>
Char. 9 Stigma: anthocyanin coloration Char. 10 Stigma: color	<p>China Both characteristics 9 and 10 involve colors of stigma. For characteristic 9, if the expression of anthocyanin coloration is above "medium" level, the true color of stigma will be obscured. We suggest the name of characteristic 10 be changed into <u>"varieties with anthocyanin coloration absent or weak only"</u>: stigma: color.</p>
Char.11 Stigma: length	<p>Kenya Due to minor differences on the length of stigma in some varieties, theres need to have fewer states that are well illustrated.</p>
Char. 12 Flower with pedicel: Length of flower	<p>Kenya Indicate the part to be examined with an arrow.</p>
Char. 13 Flower: self-fertility	<p>Hungary Flower: self-fertility": We would prefer characteristic "Flower: fertility" instead of the suggested one. A sterile female line (A-line) of a hybrid variety always has its fertile version (B-line), and usually there is no other difference between the A-line and the B-line than the sterility/fertility, which is definitely not "selffertility".</p> <p>However, I have to admit that we have no idea, how to observe characteristic "Flower: fertility".</p>

Char. 16 Dry stamen: color	France France can provide an example variety for states 2 and 5. Germany To check whether to observe at stage 65-69 instead 70-75.
Char. 18 Plant: length	France To check whether to observe at stage 69-75 instead 70-75 Some inbred lines are shorter than hibryd Sibelius and Arusk, know in France as around 3-4. We will propose a range of example varieties, specially for the shortest states. Would it be possible, before flying to Argentina, to get the Spanish range so we can check if it suits to French range of varieties? GERMANY to delete 'strong tendency short' (6) and 'strong tendency high' (10) ['tendency' is und regarding direction up rsp. down: 'strong tendency short' could be above or below 'short'; 'strong tendency high' could be above or below 'high' (also in proj.3 'tendency' is not the same way)] - to replace hyphens in states of expressions by 'to' Japan Plant: length is measured by extending the leaf. So, this characteristic is affected by length. And this characteristic may be affected by panicle length. If we keep 15 notes, "culm: length" is appropriate.
Char. 19 Stem: diameter	France: To check whether to observe at stage 69-85 instead 75-85 Is it easy to score this characteristic as a VG one and to use a 9 note scale?
Char. 23 Panicle: length of neck	Japan 9 notes are appropriate. "Neck of panicle: length above flag sheath" is appropriate.
Char. 29 Grain: color after threshing	Japan Example varieties of "purple" and "black" are needed.
Char. 33 Grain: content of tannin	France The protocole added in the explanations is suitable for presence of testa, not for evaluation of tannin content (although both characteristics are closely linked). 5 states of expression will be more realistic.
Char. 34 Grain: type of endosperm	China There seems to be too many states. Maybe a scale of "1, 2, 3, 4, 5" is better suited for this characteristics given the distinguishing power of naked eye.
Char. 35 Grain: color of vitreous albumen of endosperm	Germany To read "Grain: color of vitreous endosperm" to be in line with Char. 34.
Char. 36 Plant: photoperiod sensitivity	Hungary We have no idea how to observe this characteristic, so an explanation in Chapter 8.2 should be warmly welcomed.

	Kenya Include - Grain: Shape in Profile view Consider including the above characteristic as provided in the previous version of 1989 - TG/122/3.
Ad. 13	France In doubtful cases the heads....
Ad. 36	Germany to check whether it should read '... at least 12 hours.'
Technical questionnaire	Germany Botanical names: to harmonize with botanical names at front page.
