TG/PECAN(proj.6)

ORIGINAL: English

DATE: 2009-08-20

## INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS

GENEVA

DRAFT

## PECAN NUT \*

UPOV Code: CARYA\_ILL

*Carya illinoensis* (Wangenh.) K. Koch

## GUIDELINES

## FOR THE CONDUCT OF TESTS

## FOR DISTINCTNESS, UNIFORMITY AND STABILITY

*prepared by an expert from Argentina**to be considered by the**Technical Working Party for Fruit Crops**at its fortieth session, to be held in Angers, France, from September 21 to 25, 2009*

Alternative Names: \*

Botanical name	English	French	German	Spanish
<i>Carya illinoensis</i> (Wangenh.) K. Koch	Pecan nut	Pacancier	Pekan, Pekanuß	Nuez pecán, Pecan Nogal Pacanero

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

## ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

\* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website ([www.upov.int](http://www.upov.int)), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Carya illinoensis* (Wangenh.) K. Koch of the family *Juglandaceae*.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of dormant budsticks (15 cm long and 1-1.5 cm in diameter with 3 groups of buds) to be sent at grafting time.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

8 dormant budsticks

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent **growing** cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

3.3.1 The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination. In particular, it is essential that the trees produce a satisfactory crop of fruit in each of the two growing cycles.

3.3.2 The recommended method of observing the characteristic is indicated by the following key in the second column of the Table of Characteristics:

- MG: single measurement of a group of plants or parts of plants  
MS: measurement of a number of individual plants or parts of plants  
VG: visual assessment by a single observation of a group of plants or parts of plants  
VS: visual assessment by observation of individual plants or parts of plants.

### 3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 5 trees.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

### 3.5 *Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 5 trees or parts taken from each of 5 plants. In the case of parts of trees, the number to be taken from each of the trees should be 2.

### 3.6 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

## 4. Assessment of Distinctness, Uniformity and Stability

### 4.1 *Distinctness*

#### 4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

#### 4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

#### 4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

#### 4.2 *Uniformity*

4.2.1. It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2. For the assessment of uniformity, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 5 plants, no off-types are allowed.

#### 4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new plant stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

### 5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Nut: length (characteristic 21)
- (b) Nut: width in lateral view (characteristic 22)
- (c) Nut: width in ventral view (characteristic 23)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

## 6. Introduction to the Table of Characteristics

### 6.1 *Categories of Characteristics*

#### 6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

#### 6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by \*) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

### 6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

### 6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

### 6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

### 6.5 *Legend*

(\*) Asterisked characteristic – see Chapter 6.1.2

QL: Qualitative characteristic – see Chapter 6.3

QN: Quantitative characteristic – see Chapter 6.3

PQ: Pseudo-qualitative characteristic – see Chapter 6.3

(+) See Explanations on the Table of Characteristics in Chapter 8.2

## 8. Explanations on the Table of Characteristics

### 8.1 *Explanations covering several characteristics*

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

Ad. 6 to 14: Phenological state (V9) – end of leaflet expansion – fully developed leaflets. Leaves on the middle section of a year shoot.

Ad. 17 to 18: Phenological state (R6) – fully receptivity of stigma – Stigma is turgescient with brilliant aspect. Observation must be done on the terminal section of a year shoot.

Ad. 21 to 25: Phenological state (R14) – shuck opening – 24 weeks after pollination. Full development of nut. Observation must be done on the terminal section of a year shoot.

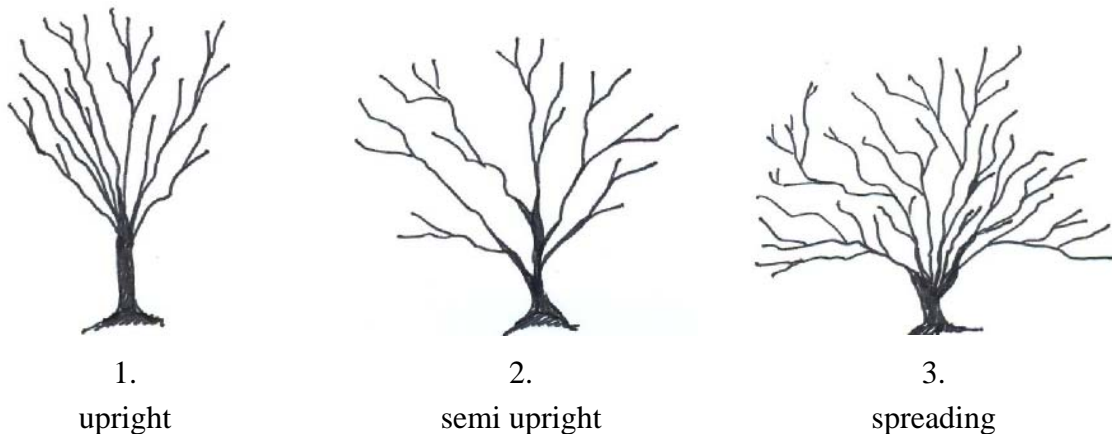

### 8.2 *Explanations for individual characteristics*

#### Ad. 1: Tree: vigor

The vigor of the plant should be considered as the overall abundance of vegetative growth.

#### Ad. 3: -Tree: growth habit

(to include the same drawings of the last version)

Ad. 7: Leaf: length of terminal leaflet

Ad. 8: Leaf: width of terminal leaflet

Ad. 9: Leaf: ratio length/width of terminal leaflet

Ad. 10: Leaf: length of petiole

Ad. 11: Lateral leaflet: curvature of longitudinal axis

Ad. 12: Lateral leaflet: presence of petiolule

Ad. 13: Lateral leaflet: irregularity

Ad. 14: Only varieties with irregular lateral leaflets: Lateral leaflet: position of broadest width of leaflet

To observe on fully developed leaves on the middle third of branches growing in the currently year.

Ad. 13: Lateral leaflet: irregularity

1  
absent

2  
medium

3  
strong

Ad. 17: Stigma: type

1  
entire

2  
bifurcate

1  
entire

2  
bifurcate

Ad. 21: Nut: length

Ad. 22: Nut: width in lateral view

Nut: width in lateral view

Ad. 23: Nut: width in ventral view

Nut: width in ventral view

Ad. 24: Nut: shape in ventral view

Ad. 26: Nut: shape in cross section with suture in vertical position

Ad. 27: Nut: shape of apex in lateral view

Ad. 40: Time of beginning of receptivity of stigma

To be provided

### 8.3 *Pecan Nut: Phenological Stages*

V1: sleeping bud  
V2: inflated bud  
V3: external splited bud  
V4: internal splited bud  
V5: developing leaves  
V6 – V9: developing leaflets  
R1: catkin prolonging  
R2: pollen liberation start.  
R3: Pollen liberation fulness  
R4: End of pollen liberation  
R5: Stigma receptivity starts  
R6: Stigma receptivity fulness  
R7: End of stigma receptivity  
R8: early nut development  
R9: quick nut development  
R10: late nut development  
R11: starts the nut fill  
R12: nut fill  
R13: end of nut fill  
R14: opening husk  
S1: yellowing leaves starts  
S2: fully yellowing leaves  
S3: end of yellowing leaves  
S4: start downfall leaves  
S5: fully downfall leaves  
S6: end of downfall leaves

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- |   |         |        |
|---|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma)    | Yes [ ] | No [ ] |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [ ] | No [ ] |
| (c) Tissue culture  | Yes [ ] | No [ ] |
| (d) Other factors   | Yes [ ] | No [ ] |

Please provide details for where you have indicated "yes".

.....

10. I hereby declare that, to the best of my knowledge, the information provided in this form is correct:
