Antalya, Türkiye, May 1 to 5, 2023****Original:** English  
**Date:** May 1, 2023

---

**ADDENDUM TO:  
ASSESSING DISTINCTNESS IN DISEASE RESISTANCE CHARACTERISTICS**

*Document prepared by experts from CropLife International, Euroseeds and the International Seed Federation (ISF)*

*Disclaimer: this document does not represent UPOV policies or guidance*

The annex to this document contains a copy of a presentation “Disease resistance characteristics”, to be made by experts from CropLife International, Euroseeds and the International Seed Federation (ISF), at the fifty-seventh session of the Technical Working Party for Vegetables (TWV).

[Annex follows]

# Disease Resistance Characteristics

**UPOV TWV**

Antalya, 1 – 5 May 2023

## **TWV/57/1 Rev. AGENDA: Matters for discussion**

4. (b) Document TGP/12 “Guidance on certain physiological characteristics”: Word “highly” in only one state of expression (disease resistance characteristics) (document TWP/7/2)

*The TWV is invited to consider whether to revise the states of expression in the example characteristic in document TGP/12/2, Section 2.3.2, to address the use of the word “highly” in only one state of expression.*

5. Assessing distinctness in disease resistance characteristics (document TWV/57/10)

*Par. 11: Standard form of QN Characteristic for disease resistance “absent or low”, note 1; “medium”, note 2; and “high”, note 3*

### ***Characteristics for disease resistance “absent or low”, “medium”, and “high”***

- Disease resistances are different from the other characteristics.
- In the case of disease resistances, with different disease pressure, or inoculum concentration and/or climatic conditions, the expression of the characteristic may be different
  - Concerns:
    - this may bring disagreement between a declaration and DUS trial findings.
    - We note that there is a clear difference between “absent” and “low”. We argue that they shouldn’t be in the same category.
  - We would propose to keep “S/IR/HR” and “absent/present” that give clear distinction than this new proposal.

2

### ***Scale for disease resistance characteristic “absent or low”, note 1; “medium”, note 2; and “high”, note 3***

- The proposed scaling leads to challenges, for example, when is “low” entering the area of “medium” while absent or susceptible are more clear-cut boundaries.
- Concern:
  - Potential high risk of confusion on interpretation from breeder to examiner and in cases where parties involved may not be well informed of the UPOV guideline

3

## Terminology for disease resistance scaling: “absent or low”, “medium” and “high”

- The following basic concepts in plant-microbes' interactions are a key for deciding on the terminology. In phytopathology research, the outcome of the interaction between the plant and the pathogen is described as follows:

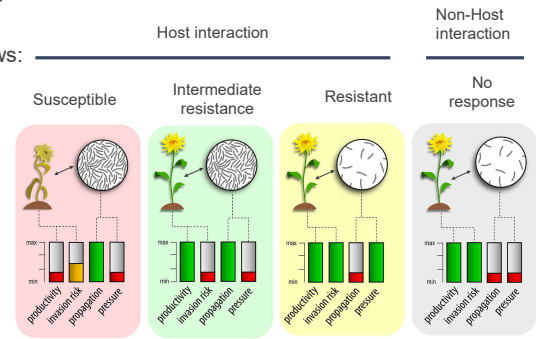

- Plant State:**

- Case of Host interaction: Susceptible, resistant or intermediate (with some more adjectives)
- Case of Non-host interaction: No (visible) response

- Pathogen State:** Absent, Low, Medium or High invasive state in the plant

- Outcome of the Interaction** between the plant and the pathogen depends on the gene pool present in both organisms (plant and pathogens) and leads to both described states in the plant (S/R/IR) and in the pathogen (Absent or low/medium/high) – Based on detection (visual scaling (from 0 to 5/9/10, etc.) or molecular/microscopic detection)

➡ Are we describing the plant state or the pathogen state for the DUS assessment?

Adapted from Gorshkov and Tsers, Biological reviews, 2022, 97, pp. 45–66.

## The ISF terminology for disease scaling is reported by Phytopathology researchers in diverse crops & in peer-reviewed journals (since as early as the 1970s)

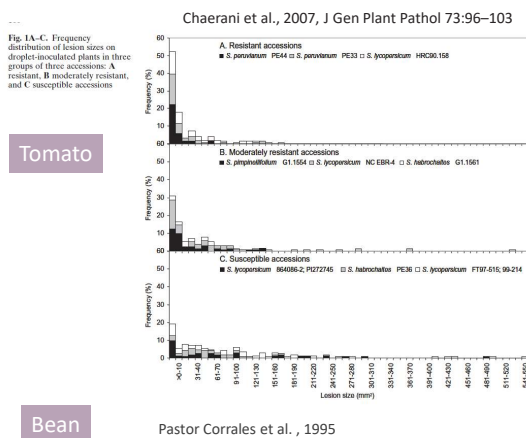

Table 2. Reaction of common bean accessions to mixtures of isolates of *Colletotrichum lindemuthianum* from CIAT-Popayán, Middle America, and Andean South America

| Anthracnose reaction <sup>a</sup> | CIAT-Popayán <sup>b</sup> |             | CIAT-Palmira, screenhouse <sup>c</sup> |                      | Both <sup>d</sup> |
|-----------------------------------|---------------------------|-------------|--|----------------------|-------------------|
|                                   | Field                     | Screenhouse | Middle America                         | Andean South America |                   |
| Resistant                         | 4,939                     | 3,778       | 1,667                                  | 2,806                | 1,270             |
| Intermediate                      | 4,410                     | 1,511       | 693                                    | 392                  | 37                |
| Susceptible                       | 10,795                    | 4,060       | 1,418                                  | 580                  | 191               |

<sup>a</sup>Evaluation based on 1-9 scale: 1 = no visible anthracnose symptoms; 9 = severely diseased; grades 1, 2, and 3 are resistant; 4, 5, and 6 intermediate; 7, 8, and 9 susceptible.

### ***Assessing distinctness on one note difference***

- REF: TWV/57/10 11 (f)

*Distinctness may be assessed on the basis of a one note difference for disease resistance characteristics using a condensed quantitative scale of three notes (Notes 1-3). In this case, the pair of varieties should have been subject to side-by-side comparison in the same trial (pairwise distinctness) or examined with the same test protocol and using the same control varieties (validation of descriptions and positioning in variety collection).*

- Concern:
  - In practice, having notes 1-3 means that a new variety with note 2 should be subject to a side-by-side comparison in the same trial with varieties with note 1 and note 3 to conclude on distinctness on the basis of a one note difference.
- We propose notes 1, 3 and 5 in place of notes 1-3. With 1 (susceptible), 3 (intermediate resistant) and 5 (highly resistant)
  - In this case, authorities have freedom to use other control varieties to avoid including too many similar varieties in a DUS trial.

6

### **Conclusions**

- Harmonization is a target of UPOV, and we would recommend UPOV to avoid creating different terminology unless it is urgently needed
- We would encourage use of terms that are scientifically commonly used by pathologist and that can be easily relate to when comparison are done to sound peer reviewed literature

7

On behalf of Breeders' Organizations

**Thank you**
