GUIDELINES

FOR THE CONDUCT OF TESTS

FOR DISTINCTNESS, UNIFORMITY AND STABILITY

Alternative Names:^{*}

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Raphanus sativus L. var. niger (Mill.) S. Kerner,</i> <i>Raphanus sativus L. var. longipinnatus L.H. Bailey</i>	Black radish, Oriental radish	Radis rave	Rettich	Rábano de invierno, Rábano negro
<i>Raphanus sativus L. var. sativus</i>	Radish, Garden Radish, European Radish, Chinese Small Radish, Western Radish	Radis de tous les mois	Radieschen	Rabanito, Rábano

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Raphanus sativus* L. var. *sativus*, *Raphanus sativus* L. var. *niger* (Mill.) S. Kerner and hybrids between those species.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed.

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

14,000 seeds.

The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 60 plants for varieties of the N-type varieties and 200 plants for varieties of the S-type varieties which should be divided between at least two replicates (see Chapter 8.1).

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.1.4 Number of Plants / Parts of Plants to be Examined

Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 40 plants or parts taken from each of 40 plants and any other observations made on all plants in the test, disregarding any off-type plants.

4.1.5 Method of Observation

The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the second column of the Table of Characteristics (see document TGP/9 “Examining Distinctness”, Section 4 “Observation of characteristics”):

MG: single measurement of a group of plants or parts of plants
MS: measurement of a number of individual plants or parts of plants
VG: visual assessment by a single observation of a group of plants or parts of plants
VS: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)

“Visual” observation (V) is an observation made on the basis of the expert’s judgment. For the purposes of this document, “visual” observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. color charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)

For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, “G” provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 Cross pollinated varieties

For the assessment of uniformity should be according to the recommendations for cross-pollinated varieties in the General Introduction. However, for the characteristics, Radish: shape (characteristic 17) and Radish: color of skin (characteristic 21), a population standard of 2% and an acceptance probability of 95% should be applied. In the case of a sample size of 60 plants, 3 off-types are allowed. In the case of a sample size of 200 plants, 7 off-types are allowed.

4.2.3 Hybrids and inbred lines

For the assessment of uniformity of hybrids and inbred lines, a population standard of 2 % and an acceptance probability of at least 95 % should be applied. In the case of 60 plants, 3 off-types are allowed. In the case of a sample size of 200 plants, 7 off-types are allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be further examined by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the initial material supplied.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Only N-type varieties: Ploidy (characteristic 1)
- (b) Only N-type varieties: Leaf: length (characteristic 3)
- (c) Only S-type varieties: Leaf: length (characteristic 4)
- (d) Leaf blade: number of lobes (characteristic 8)
- (e) Petiole: anthocyanin coloration (characteristic 10)
- (f) Only N-type varieties: Radish: length (characteristic 13)
- (g) Only S-type varieties: Radish: length (characteristic 14)
- (h) Only N-type varieties: Radish: diameter (characteristic 15)
- (i) Only S-type varieties: Radish: diameter (characteristic 16)
- (j) Radish: shape (characteristic 17)
- (k) Radish: number of colors of skin (excluding non-thickened root) (characteristic 21)
- (l) Radish: color of skin at stem end (characteristic 22)
- (m) Only varieties with Radish: Number of colors of skin: two: Radish: extent of white color from non-thickened root end (characteristic 25)
- (n) Time to harvest maturity (characteristic 28)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction and document TGP/9 “Examining Distinctness”

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

6.2.1. States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.2.2 In the case of qualitative and pseudo-qualitative characteristics (see Chapter 6.3), all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

State	Note
small	3
medium	5
large	7

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

State	Note
very small	1
very small to small	2
small	3
small to medium	4
medium	5
medium to large	6
large	7
large to very large	8
very large	9

6.2.3 Further explanation of the presentation of states of expression and notes is provided in document TGP/7 “Development of Test Guidelines”.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 *Example Varieties*

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 *Legend*

(*) Asterisked characteristic – see Chapter 6.1.2

QL Qualitative characteristic – see Chapter 6.3

QN Quantitative characteristic – see Chapter 6.3

PQ Pseudo-qualitative characteristic – see Chapter 6.3

8. Explanations on the Table of Characteristics

8.1 *Grouping for Raphanus sativus L.:*

Grouping for varieties to S-type and N-type varieties is based on the time of harvest maturity:

	Harvest maturity	Example variety
N-type varieties	> 60 days	Oshin (N), Sutong (N), Miyashige nagabuto (N)
S-type varieties	< 35 days	Flamboyant 2 (S)

Those varieties of which the harvest maturity falls between 35 and 60 days should be classified in a next step taking into account length and diameter of the radish as follows:

	Length of radish (for elongated varieties)	Diameter of radish (for rounded varieties)
N-type varieties	>15 cm	>3.5 cm
S-type varieties	<10 cm	<2.5 cm

Varieties which fall still between N-type varieties and S-type varieties should be tested in both groups.

8.2 *Explanations covering several characteristics*

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

- All observations on the seedling and the cotyledon should be made when the first true leaf is expanded.
- All observations on the leaf and the radish should be made at the time of harvest maturity depending on the type.
- All observations on the leaf should be made on fully developed leaves.

8.3 *Explanations for individual characteristics*

Ad. 1: Only N-type varieties: ploidy

Observations should be made by standard cytological methods such as:

- determination of the number of chromosomes of the non-thickened root meristem
- length of stomata on the lower side of the cotyledon (tetraploid varieties have more and longer stomata than diploid varieties)
- examination of chloroplasts of the guard cells on the lower side of the cotyledon (the guard cells of tetraploid varieties are bigger and contain more chloroplasts (> 20) than those of diploid varieties (> 10)).
- Flow cytometry (DNA quantification method)

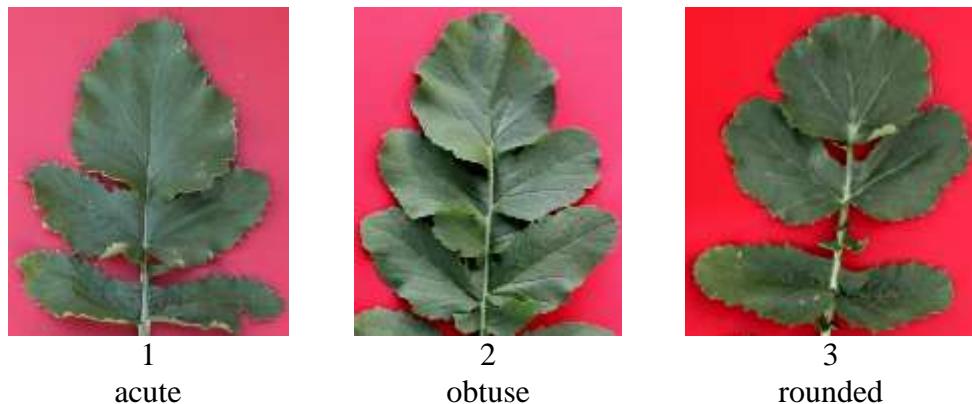

Observations should be made on at least 5 plants.

Ad. 2: Leaf: attitude

N-type varieties should be observed 30 days after sowing, because the characteristic might be at a later stage influenced by the position of the radish in the soil.

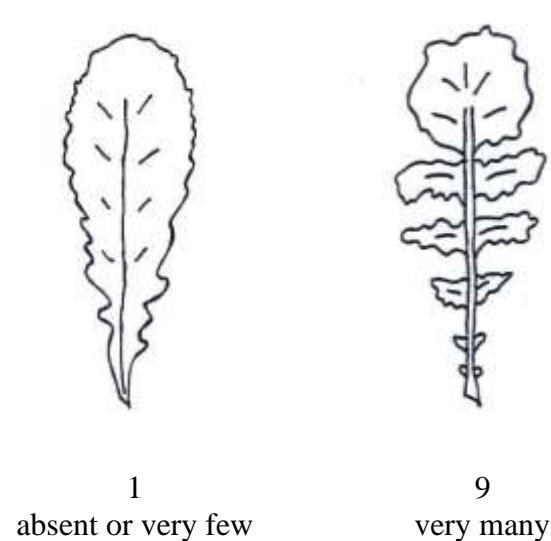

S-type varieties should be observed at the time of harvest maturity.

Ad. 6: Leaf blade: shape of apex

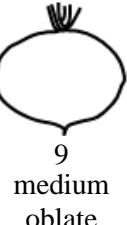

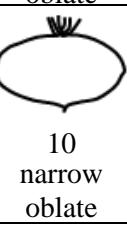

Ad. 8: Leaf blade: number of lobes

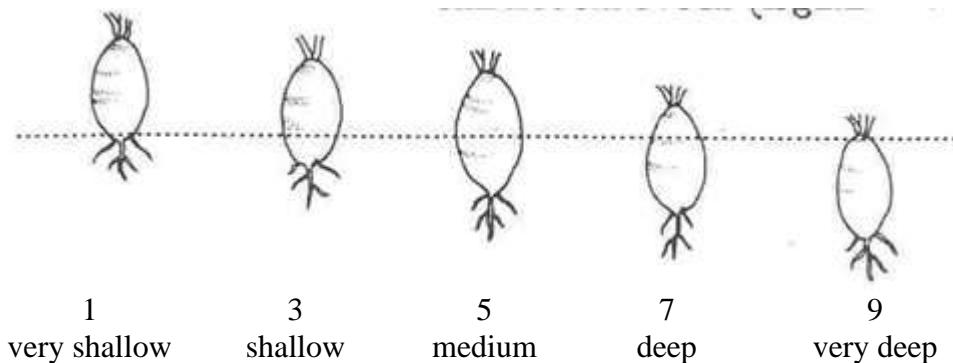

Parts of the leaf blade are considered as lobes if their length is at least equivalent to the width of the leaf petiole at their point of attachment and if both notches of the blade have at least half the length of the lobe itself.

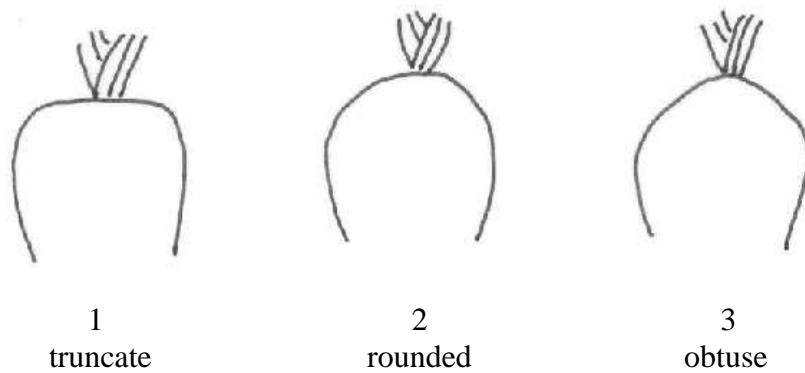

Ad. 17: Radish: shape

		← broadest part →		
		(below middle)	at middle	(above middle)
broad (compressed) ←		 4 acicular		
		 5 oblong		
		 6 narrow elliptic		 1 narrow triangular
	→ width (ratio length/width)	 12 bell shaped	 11 obovate	 7 medium elliptic
		 3 ovate		 2 medium triangular
			 8 circular	
			 9 medium oblate	
			 10 narrow oblate	

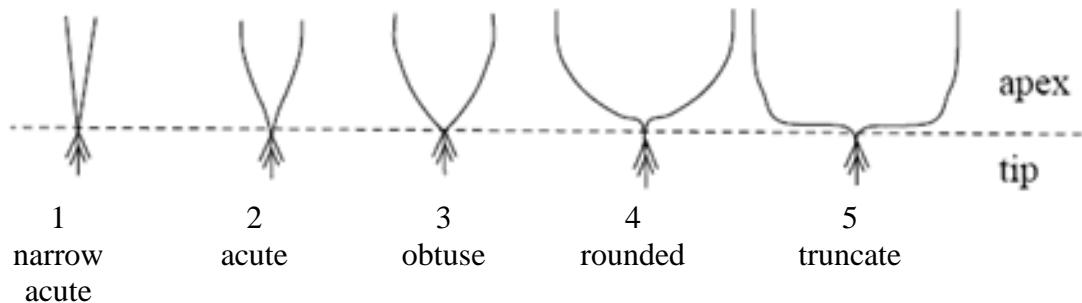

Ad. 18: Only N-type varieties: Radish: position in soil

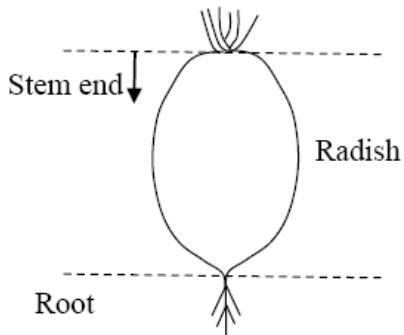

Ad. 19: Radish: shape of shoulder

Ad. 20: Radish: shape of apex

Ad. 22: Radish: color of skin at stem end

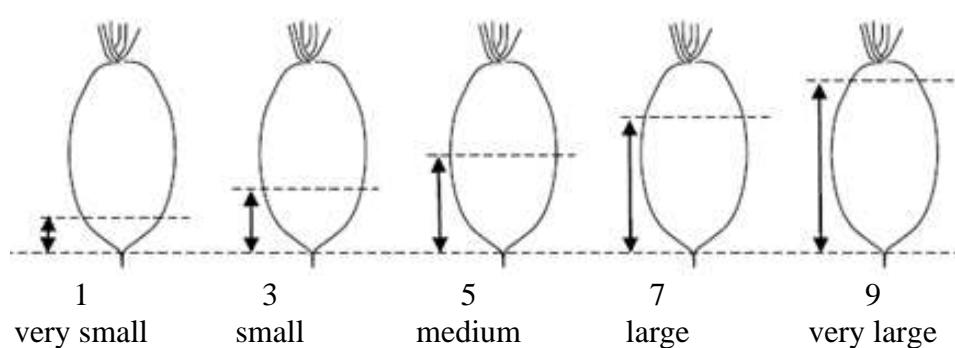

Ad. 24: Only N-type varieties: Radish: red color pattern of skin

Ad. 25: Only varieties with Radish: Number of color of skin: two: Radish: extent of white color from non-thickened root end

The extent of white tip should be observed in relation to the total length of the radish.

Ad. 27: Radish: main color of flesh

The main color is the color with the largest surface area. To be observed in longitudinal section.

Ad. 28: Time of harvest maturity

Time of harvest maturity is reached should be observed at growth stage 48 (see Chapter 8.4).

Ad. 29: Radish: tendency to become pithy

After having reached the harvest maturity radishes may be repeatedly harvested and cut in cross section to determine the tendency of becoming pithy. In this case, the number of days after sowing is to be recorded when 50% of the plants show this characteristic. Varieties which are very early pithy correspond to the expression very strong, varieties becoming pithy very late correspond to the expression absent or very weak.

8.4 *Decimal code for growth stages*

Phenological growth stages and BBCH-Identification keys of non-thickened root and stem vegetables (radish = *Raphanus sativus* L.) Feller et al., 1995 (Meyer, 1997)

Code	Description
Principal growth stage 0: Germination	
09:	Emergence: cotyledons break through soil surface
Principal growth stage 1: Leaf development (Main shoot)	
10:	Cotyledons completely unfolded; growing point or true leaf initial visible
19:	9 or more true leaves unfolded
Principal growth stage 4: Development of harvestable vegetative plant parts	
41:	Non-thickened roots beginning to expand (diameter > 0.5 cm)
45:	50 % of the expected non-thickened root diameter reached
48:	80 % of the expected non-thickened root diameter reached
49:	Expansion complete; typical form and size of non-thickened roots reached

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

9. Information on plant material to be examined or submitted for examination.

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different non-thickened rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | |
|---|------------------------------|-----------------------------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes <input type="checkbox"/> | No <input type="checkbox"/> |
| (b) Chemical treatment (e.g. growth retardant, pesticide) | Yes <input type="checkbox"/> | No <input type="checkbox"/> |
| (c) Tissue culture | Yes <input type="checkbox"/> | No <input type="checkbox"/> |
| (d) Other factors | Yes <input type="checkbox"/> | No <input type="checkbox"/> |

Please provide details for where you have indicated “yes”.
