INTERNATIONAL UNION FOR THE PROTECTION OF NEW VARIETIES OF PLANTS
 GENEVA

MELON

UPOV Code: CUCUM_MEL

Cucumis melo L.

*

GUIDELINES
FOR THE CONDUCT OF TESTS
FOR DISTINCTNESS, UNIFORMITY AND STABILITY

Alternative Names:^{*}

<i>Botanical name</i>	<i>English</i>	<i>French</i>	<i>German</i>	<i>Spanish</i>
<i>Cucumis melo L.</i>	Melon	Melon	Melone	Melón

The purpose of these guidelines (“Test Guidelines”) is to elaborate the principles contained in the General Introduction (document TG/1/3), and its associated TGP documents, into detailed practical guidance for the harmonized examination of distinctness, uniformity and stability (DUS) and, in particular, to identify appropriate characteristics for the examination of DUS and production of harmonized variety descriptions.

ASSOCIATED DOCUMENTS

These Test Guidelines should be read in conjunction with the General Introduction and its associated TGP documents.

* These names were correct at the time of the introduction of these Test Guidelines but may be revised or updated. [Readers are advised to consult the UPOV Code, which can be found on the UPOV Website (www.upov.int), for the latest information.]

1. Subject of these Test Guidelines

These Test Guidelines apply to all varieties of *Cucumis melo* L.

2. Material Required

2.1 The competent authorities decide on the quantity and quality of the plant material required for testing the variety and when and where it is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities and phytosanitary requirements are complied with.

2.2 The material is to be supplied in the form of seed

2.3 The minimum quantity of plant material, to be supplied by the applicant, should be:

100 g or 2000 seeds.

The seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority.

2.4 The plant material supplied should be visibly healthy, not lacking in vigor, nor affected by any important pest or disease.

2.5 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

3. Method of Examination

3.1 *Number of Growing Cycles*

The minimum duration of tests should normally be two independent growing cycles.

3.2 *Testing Place*

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness".

3.3 *Conditions for Conducting the Examination*

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

The recommended method of observing the characteristic is indicated by the following key in the second column of the Table of Characteristics:

- MG: single measurement of a group of plants or parts of plants
MS: measurement of a number of individual plants or parts of plants
VG: visual assessment by a single observation of a group of plants or parts of plants

3.4 *Test Design*

3.4.1 Each test should be designed to result in a total of at least 20 plants, which should be divided between two or more replicates.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 *Number of Plants / Parts of Plants to be Examined*

Unless otherwise indicated, all observations should be made on 20 plants or parts taken from each of 20 plants.

3.6 *Additional Tests*

Additional tests, for examining relevant characteristics, may be established.

4. Assessment of Distinctness, Uniformity and Stability

4.1 *Distinctness*

4.1.1 General Recommendations

It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in these Test Guidelines.

4.1.2 Consistent Differences

The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.

4.1.3 Clear Differences

Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Test Guidelines are familiar with the recommendations contained in the General Introduction prior to making decisions regarding distinctness.

4.2 *Uniformity*

4.2.1 It is of particular importance for users of these Test Guidelines to consult the General Introduction prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in these Test Guidelines:

4.2.2 The assessment of uniformity for cross-pollinated varieties should be according to the recommendations for cross-pollinated varieties in the General Introduction.

4.2.3 For the assessment of uniformity of self-pollinated varieties, vegetatively propagated varieties and hybrid varieties, a population standard of 1 % and an acceptance probability of at least 95 % should be applied. In the case of a sample size of 20 plants, 1 off-type is allowed.

4.3 *Stability*

4.3.1 In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Where appropriate, or in cases of doubt, stability may be tested, either by growing a further generation, or by testing a new seed stock to ensure that it exhibits the same characteristics as those shown by the previous material supplied.

4.3.3 Where appropriate, or in cases of doubt, the stability of a hybrid variety may, in addition to an examination of the hybrid variety itself, also be assessed by examination of the uniformity and stability of its parent lines.

5. Grouping of Varieties and Organization of the Growing Trial

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organize the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics:

- (a) Inflorescence: sex expression (at full flowering) (characteristic 12)
- (b) Fruit: shape in longitudinal section (characteristic 28)
- (c) Fruit: ground color of skin (characteristic 29)
- (d) Fruit: warts (characteristic 38)
- (e) Fruit: grooves (characteristic 43)
- (f) Fruit: cork formation (characteristic 48)
- (g) Fruit: main color of flesh (characteristic 54)
- (h) Seed: length (characteristic 60)
- (i) Seed: color (characteristic 63)
- (j) Resistance to *Fusarium oxysporum* f. sp. *melonis*, race 0 (characteristic 69.1)
- (k) Resistance to *Fusarium oxysporum* f. sp. *melonis*, race 1 (characteristic 69.2)
- (l) Resistance to *Fusarium oxysporum* f. sp. *melonis*, race 2 (characteristic 69.3)

5.4 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the General Introduction.

6. Introduction to the Table of Characteristics

6.1 *Categories of Characteristics*

6.1.1 Standard Test Guidelines Characteristics

Standard Test Guidelines characteristics are those which are approved by UPOV for examination of DUS and from which members of the Union can select those suitable for their particular circumstances.

6.1.2 Asterisked Characteristics

Asterisked characteristics (denoted by *) are those included in the Test Guidelines which are important for the international harmonization of variety descriptions and should always be examined for DUS and included in the variety description by all members of the Union, except when the state of expression of a preceding characteristic or regional environmental conditions render this inappropriate.

6.2 *States of Expression and Corresponding Notes*

States of expression are given for each characteristic to define the characteristic and to harmonize descriptions. Each state of expression is allocated a corresponding numerical note for ease of recording of data and for the production and exchange of the description.

6.3 *Types of Expression*

An explanation of the types of expression of characteristics (qualitative, quantitative and pseudo-qualitative) is provided in the General Introduction.

6.4 Example Varieties

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.

6.5 Legend

(*) Asterisked characteristic – see Chapter 6.1.2

QL: Qualitative characteristic – see Chapter 6.3

QN: Quantitative characteristic – see Chapter 6.3

PQ: Pseudo-qualitative characteristic – see Chapter 6.3

MG, MS, VG: See Chapter 3.3

(a)-(e) See Explanations on the Table of Characteristics in Chapter 8.1

8. Explanations on the Table of Characteristics

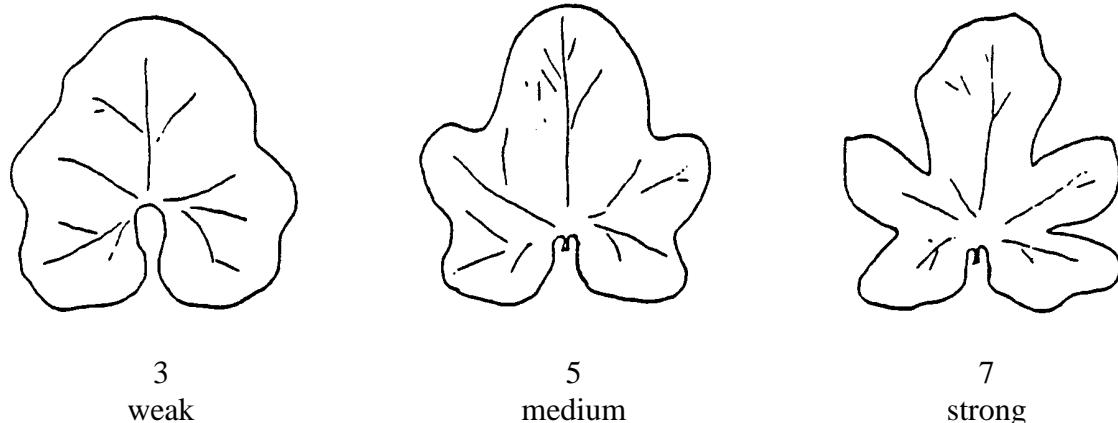

8.1 *Explanations covering several characteristics*

Characteristics containing the following key in the second column of the Table of Characteristics should be examined as indicated below:

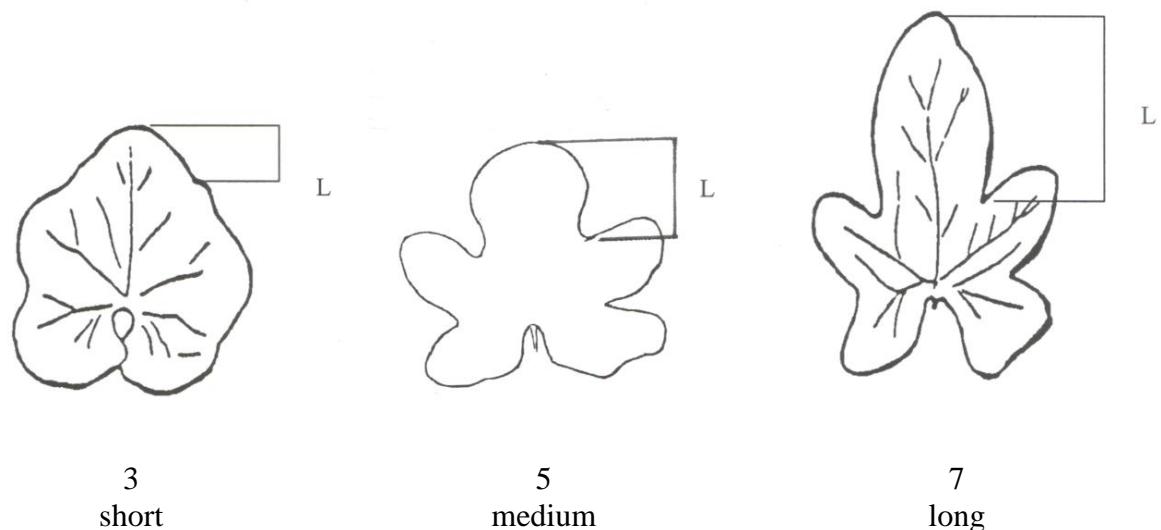

- (a) Seedling: All observations on the seedling should be made just before the development of the first true leaf.
- (b) Leaf blade: Unless otherwise indicated, all observations on the leaf blade, should be made on fully developed but not old leaves, preferably between the 5th and 8th node when the plant has at least 11 nodes.
- (c) Young fruit: All observations on the young fruit should be made on green, unripe fruits, before the color change. For most varieties this means when the fruit is half the final size. To facilitate the observation, it is recommended to harvest one young fruit per plant, if the number of fruits per plant makes that possible.
- (d) Fruit: Observations which should be made on ripened fruit. The color must not start to change to the over maturity color. When appropriate, for the flesh characteristics it is recommended to wait at least one week after the harvest before opening the fruits.
- (e) Seed: All observations on the seed should be made on fully developed and dry seeds, after washing and drying in the shade.

8.2 Explanations for individual characteristics

Ad. 6: Leaf blade: development of lobes

Ad. 7: Leaf blade: length of terminal lobe

Ad. 13: Young fruit: hue of green color of skin

The basic color of the young fruit is green. There are two true hue levels "yellowish" and "green" depending on the proportion between red and blue components in the color, and two other hue levels "greyish" that is rather a low saturation of the green color and "whitish" that results from a very light intensity of the green color.

Ad. 23: Fruit: change of skin color from young fruit to maturity

Ad. 52: Fruit: Rate of change of skin color from maturity to over maturity

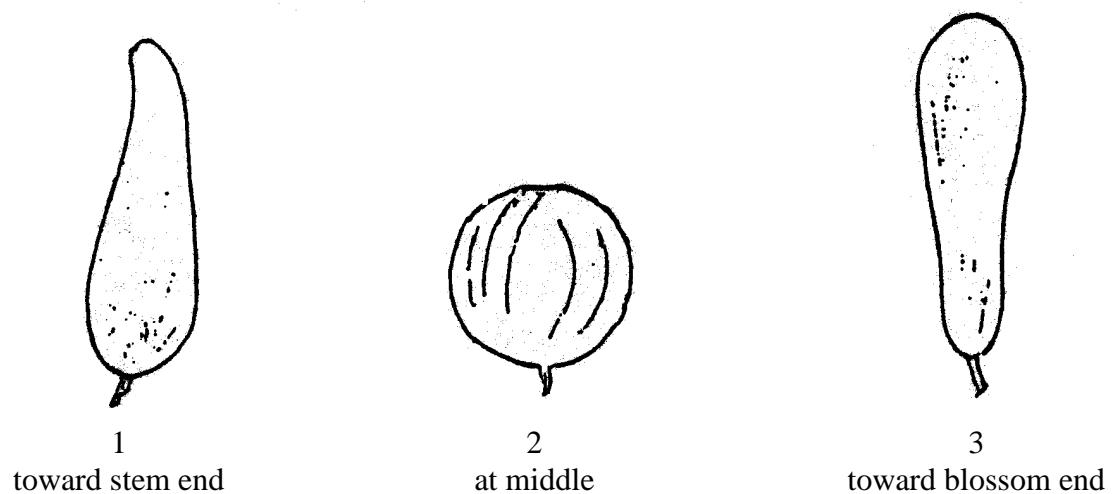

The melon fruit may have up to three different skin colors in the course of its development. The speed of evolution of the color depends on the type of variety, but within a type different speeds can also be observed. Please note that in cases where the color change is closely linked to maturity, the observation should be clear: either on the color change related to maturity (characteristic 23) or within mature fruits from mature to over mature (characteristic 53). The changing of fruit skin color can be described by using the following characteristics:

1. Stage 1: color of the young fruit (green color)
2. Change from Stage 1 to Stage 2 (Characteristics 23)
3. Stage 2: color at maturity
4. Change from Stage 2 to Stage 3 (Characteristic 53)
5. Stage 3: color at over maturity.

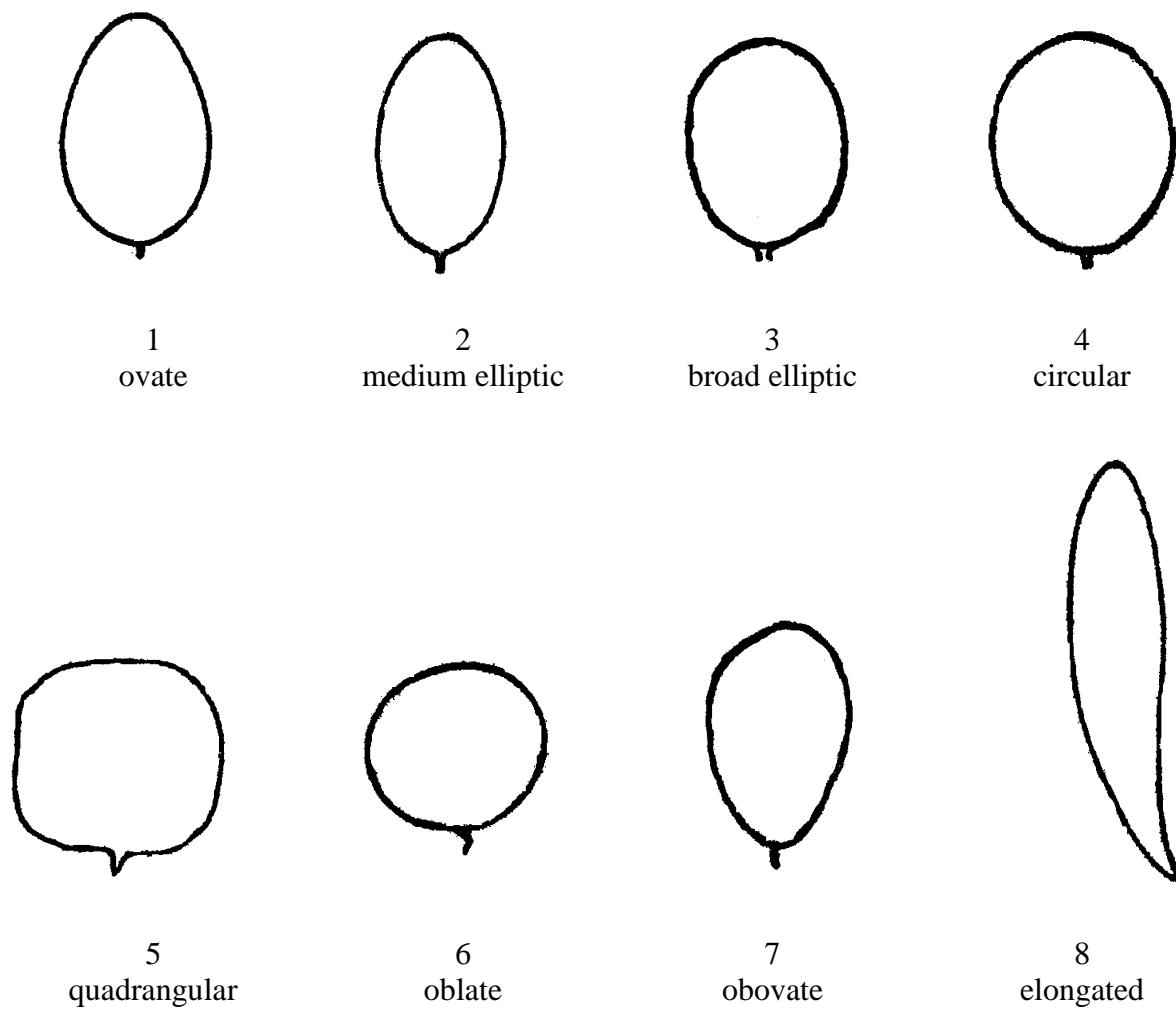

Some examples are given in the following table:

Variety	Stage 1: color of the young fruit	Change from Stage 1 to Stage 2 (Ch. 23)	Stage 2: color at maturity (Ch. 29)	Change from Stage 2 to Stage 3 (Ch. 53)	Stage 3: color at over maturity
Galia	green	late	yellow	absent	yellow
Amarillo Oro	green	late	yellow	absent	yellow
Doral	green	late	yellow	absent	yellow
Charentais	green	early	grey	fast	yellow
Alpha	green	early	grey	medium	yellow
Clipper	green	early	grey	absent	grey
Vendome	green	early	grey	medium	yellow
Corin	green	early	grey	fast	yellow
Nembo	green	early	grey	fast	yellow
Albino	green	late	white	absent	white
Honey Dew	green	late	white	absent	white
Dulcinea	green	late	white	medium	yellow
Marina	green	no-change	green	fast	yellow
Futuro	green	no change	green	medium	yellow
Goloso	green	no change	green	slow	yellow
Piel de Sapo	green	no change	green	absent	green

Ad. 27: Fruit: position of maximum diameter

Ad. 28: Fruit: shape in longitudinal section

Ad. 29: Fruit: ground color of skin
Ad. 31: Fruit: hue of ground color of skin

For example:

All the Galia type would be considered as yellow color. Hues ochre, orange, pure yellow or greenish can be considered in the group, but in a separate characteristic (31).

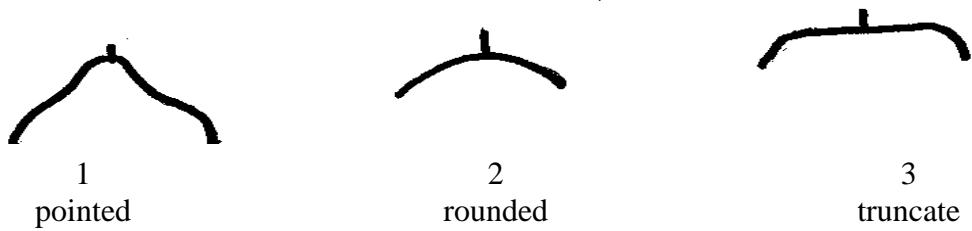

All the Charentais type would be considered as grey. Greenish, whitish, or yellowish hues (characteristic 31) can be used for distinctness, but are not recommended for grouping.

Ochre is pale brownish yellow.

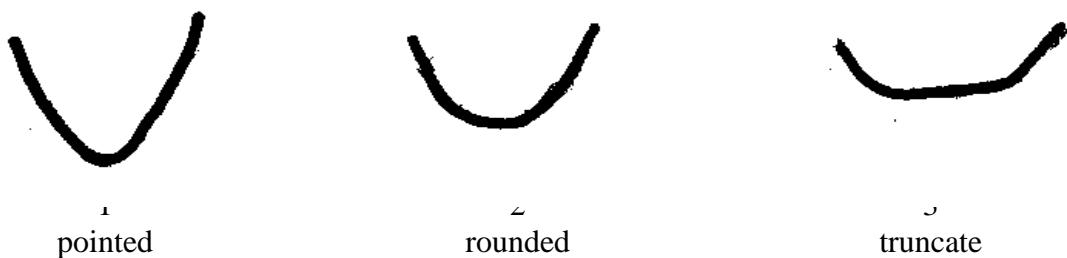

The colors given below indicate the ground color of skin of the variety in question.

		Hue of ground color (characteristic 31)	
Example variety	Ground color (characteristic 29)	State	Note
Amarillo-Canario	yellow	absent or very weak	1
Albino	white	absent or very weak	1
Piel de Sapo	green	absent or very weak	1
Sirio	grey	absent or very weak	1
Romeo	grey	whitish	2

Ad. 40: Fruit: shape of base

Ad. 41: Fruit shape of apex

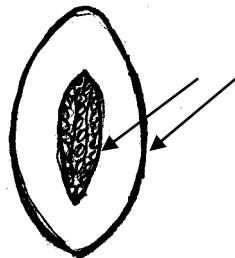

Ad. 47: Fruit: creasing of surface

Ad. 52: Fruit: Rate of change of skin color from maturity to over maturity

See Ad. 23, Ad. 52

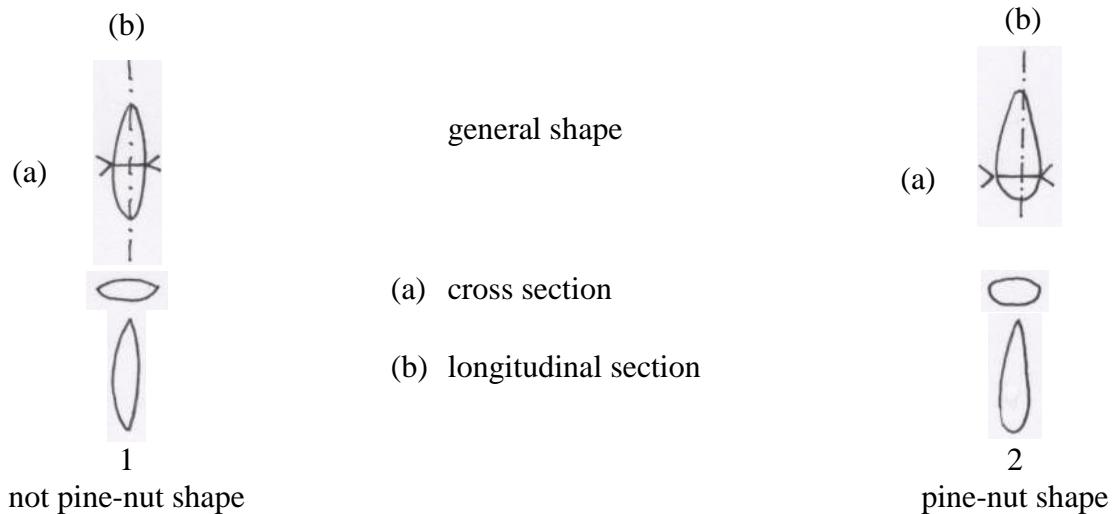

Ad. 53: Fruit: width of flesh in longitudinal section (at position of maximum fruit diameter)

Ad. 57: Firmness of flesh

Firmness of the flesh should be assessed in the central third of the fruit. The assessment can be made by pressing the flesh with the blunt end of a pencil, or similar instrument, midway between the skin and the mucilage.

Ad. 62: Seed: shape

Pine-nut shape seed (Piñonet) is controlled by a recessive characteristic with simple genetic regulation. Seed with pine-nut shape resembles the shape of a pine nut and has the following features:

- the hilum end is slightly more pointed, with very small wings;
- the apical end has a tendency to be more rounded;
- in cross section the seed has a tendency to be more symmetrically elliptical;
- the surface is not covered with arista.

Ad. 68: Shelf life of fruit

Shelf life is the time that the fruit remains firm in storage.

Five fruits per plot are stored in boxes in single layers. The boxes can be stored one on top on another if air can circulate between them. The storage area does not need to be climatically controlled, but must have naturally good conditions for storing fruits.

Observations are made at regular intervals of 3 to 4 days, noting the firmness of fruits, taking care not to damage them, and removing those which are damaged or rotten. The observation is to determine when the fruits become soft, i.e. when the firmness of the fruit becomes equal or lower than Note 3 “soft” in characteristic 57.

Ads. 69.1 - 69.3: Resistance to *Fusarium oxysporum* f. sp. *melonis*, races 0, 1 and 2 (Fom)

1.	Pathogen	<i>Fusarium oxysporum</i> f. sp. <i>melonis</i>		
2.	Quarantine status	no		
3.	Host species	<i>Cucumis melo</i>		
4.	Source of inoculum	GEVES (FR), Naktuinbouw (NL)		
5.	Isolate	Fom: 0, Fom: 1, Fom: 2		
6.	Establishment isolate identity	use differential varieties:		

	Gene	Race 0	Race 1	Race 2
Charentais T		S	S	S
Védrantais	<i>Fom-1</i>	R	S	R
Charentais Fom-2	<i>Fom-2</i>	R	R	S
Isabelle, Jador		R	R	R

7.	Establishment pathogenicity	use susceptible melon varieties
8.	Multiplication inoculum	
8.1	Multiplication medium	on agar medium – e.g. Potato Dextrose Agar
8.2	Multiplication variety	-
8.3	Plant stage at inoculation	-
8.4	Inoculation medium	on liquid medium
8.5	Inoculation method	-
8.6	Harvest of inoculum	-
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-
9.	Format of the test	
9.1	Number of plants per genotype	at least 20
9.2	Number of replicates	e.g. 3
9.3	Control varieties	Jaune Canari 2 (susceptible) Védrantais, Arapaho, Rubbens, Anasta, Cleo (resistant, depending on the considered race)

	<i>Gene</i>	Race 0	Race 1	Race 2
Jaune Canari 2		S	S	S
Védrantais	<i>Fom-1</i>	R	S	R
Arapaho, Rubbens	<i>Fom-2</i>	R	R	S
Anasta, Cleo		R	R	R

9.4	Test design	-
9.5	Test facility	glasshouse or climatic room
9.6	Temperature	18-25°C
9.7	Light	12h
9.8	Season	all seasons
9.9	Special measures	optional: shading (no direct sunlight during 12 h after inoculation)
10.	Inoculation	
10.1	Preparation inoculum	aerated culture 7-10 days, eg. Czapek Dox broth some isolates need filtration or centrifugation resuspend the pelleted spores in demineralized water
10.2	Quantification inoculum	spore count; adjust to 10^6 - 10^7 per mL
10.3	Plant stage at inoculation	cotyledon expanded
10.4	Inoculation method	soaking of the root system in a suspension of liquid medium of fungus at least 30 sec - 5 min
10.5	First observation	7 days post inoculation
10.6	Second observation	14 -20 days post inoculation
10.7	Final observations	20 days post inoculation
11.	Observations	
11.1	Method	visual, comparative
11.2	Observation scale	
	[1] absent	Growth retardation in combination with yellowing or wilting cotyledons (useful for judging the severity of the attack), possible internal vessel browning, death of plant.
	[9] present	no symptoms
11.3	Validation of test	on standards
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL
13.	Critical control points	For Race 1.2 the modified protocol on the next page should be used.

Ad. 69.4: Resistance to *Fusarium oxysporum* f. sp. *melonis*, race 1.2 (Fom)

1.	Pathogen	<i>Fusarium oxysporum</i> f. sp. <i>melonis</i>
2.	Quarantine status	no
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	GEVES (FR), Naktuinbouw (NL)
5.	Isolate	Fom: 1.2 (moderately aggressive): TST strain
6.	Establishment isolate identity	use differential varieties: Védrantais, Virgos (susceptible) Lunasol (moderately resistant) Dinero, Isabelle (highly resistant)
7.	Establishment pathogenicity	use susceptible melon varieties
8.	Multiplication inoculum	
8.1	Multiplication medium	on agar medium e.g. Potato Dextrose Agar
8.2	Multiplication variety	-
8.3	Plant stage at inoculation	-
8.4	Inoculation medium	on liquid medium
8.5	Inoculation method	-
8.6	Harvest of inoculum	-
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-
9.	Format of the test	
9.1	Number of plants per genotype	at least 30
9.2	Number of replicates	e.g. 3
9.3	Control varieties	
	[1] susceptible	Védrantais, Virgos
	[2] moderately resistant	Lunasol (the lowest accepted level)
	[3] highly resistant	Dinero, Isabelle, Jador
9.4	Test design	-
9.5	Test facility	glasshouse or climatic room
9.6	Temperature	18-25°C
9.7	Light	at least 12h
9.8	Season	All seasons in a climatic room / in a greenhouse: be aware of the strong environmental effect: winter could be too severe and summer could be too mild.
9.9	Special measures	optional shading (no direct sunlight during 12 h after inoculation)
10.	Inoculation	
10.1	Preparation inoculum	aerated culture 7-10 d old – e.g.: Czapek Dox broth
10.2	Quantification inoculum	spore count; adjust to 2.10^4 - 10^5 per ml
10.3	Plant stage at inoculation	cotyledons expanded
10.4	Inoculation method	soaking of the trays in spore suspension; 700 ml for a tray with 25 - 30 plants, plants are not uprooted

10.5	First observation	7 - 14 days post inoculation
10.6	Second observation	14 - 21 days post inoculation
10.7	Final observations	21- 28 days post inoculation
11.	Observations	
11.1	Method	visual, comparative
11.2	Observation scale	symptoms:
	[1] susceptible	Védrantais: growth retardation, yellow cotyledons, drying, possible internal vessel browning, death of the plant
	[2] moderately resistant	Symptoms may be present, but the level of expression must be distinctly lower than the susceptible control variety. = the lowest level of resistance is defined by the behavior of Lunasol
	[3] highly resistant	Symptoms may be present, but the level of expression must be lower than the moderately control variety Lunasol.
11.3	Validation of test	on standards; Lunasol is intermediate and will show a percentage of diseased plants (quantitative evaluation)
11.4	Off-types	calibrate with Lunasol
12.	Interpretation of data in terms of UPOV characteristic states	QN
13.	Critical control points	A moderately aggressive type of Fom: 1.2 should be used as this is likely to show the difference between the presence and absence of resistance most clearly. There are two types of <i>Fusarium oxysporum</i> f. sp. <i>melonis</i> , Fom:1.2, viz. Fom: 1.2y which is a yellowing type with yellowing symptoms on leaves and another type and Fom: 1.2w which is a wilt type with wilting symptoms on leaves.

Ads. 70.1 to 70.3: Resistance to *Podosphaera xanthii* (*Sphaerotheca fuliginea*) (Powdery mildew) Px (Sf)

Ad. 71: Resistance to *Golovinomyces cichoracearum* (*Erysiphe cichoracearum*), race 1 (Powdery mildew) Gc (Ec)

1.	Pathogen	Powdery mildew: <i>Podosphaera xanthii</i> (<i>Sphaerotheca fuliginea</i>) races 1, 2, 3, 5 and 3-5 <i>Golovinomyces cichoracearum</i> (<i>Erysiphe cichoracearum</i>) race 1
2.	Quarantine status	no
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	GEVES (FR)
5.	Isolate	Px: races 1, 2, 3, 5 and 3-5; Gc: race 1

6.	Establishment isolate identity	on differentials:
----	--------------------------------	-------------------

	Powdery Mildew					race 1
	<i>Podosphaera xanthii</i> (<i>Sphaerotheca fuliginea</i>)					
	race 1	race 2	race 3	race 5	race 3-5	race 1
Védrantais	S	S	S	S	S	S
Nantais Oblong	S	S	S	S	S	R
PMR 45	R	S	S	S	S	S

PI 124112, 90625	R	R	R	R	R	R
PMR 5	R	R	S	R	S	R
PI 414723	R	R	IR	R	R/ IR	R

Legend: S susceptible (high sporulation); R resistant (low sporulation), IR (moderately resistant)

7.	Establishment pathogenicity	use susceptible melon varieties
8.	Multiplication inoculum	
8.1	Multiplication medium	detached cotyledon in Petri-dish on 0.35 – 0.5% Agar, 1-2% mannitol, possible add of 1% sucrose
8.2	Multiplication variety	susceptible varieties
8.3	Plant stage at inoculation	young, unfolded cotyledon; decontaminated with e.g. 0.05% mercuric chloride or 3 to 5% bleach (NaClO + NaCl)
8.4	Inoculation medium	air
8.5	Inoculation method	scatter conidia on the cotyledons transferred by blowing
8.6	Harvest of inoculum	use cotyledons with strong sporulation
8.7	Check of harvested inoculum	check presence of spores
8.8	Shelflife/viability inoculum	on cotyledon, 17-23°C, under very low light intensity; maximum storage time is 15 days, after the inoculation <u>Remark:</u> In case of longer term preservation, inoculate locally with a few spores, store at 14°C/12h low light per day
9.	Format of the test	
9.1	Number of plants per genotype	at least 16 plants
9.2	Number of replicates	e.g. 3

9.3	Control varieties	
-----	-------------------	--

	Powdery Mildew					
	<i>Podosphaera xanthii</i>					<i>Golovinomyces cichoracearum</i>

susceptible	Jaune Canari 2, Védrantais	Galoubet, Védrantais	Védrantais	Védrantais	Védrantais	Védrantais
moderately resistant	Escrito	Escrito, Pendragon	Nettuno	Hugo, Pendragon	Cisco	Anasta
highly resistant	Anasta, Cézanne	Anasta, Cézanne	Batista, Godiva	Arapaho	90625	Heliobel

9.4	Test design	leaf discs placed on 0.4% agar with 1- 4% mannitol and possible add of 0.003% benzimidazol
9.5	Test facility	climatic room
9.6	Temperature	20-24°C
9.7	Light	12 to 24h darkness after inoculation
9.8	Season	-
9.9	Special measures	Inoculation tower needed for even distribution of dry spores.
10.	Inoculation	
10.1	Preparation inoculum	-
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	<u>Routine method:</u> leaf disks, 2 cm in diameter, from young plants. <u>Complementary method,</u> if necessary: young plants
10.4	Inoculation method	<u>Routine method:</u> on leaf disks: inoculation tower needed for even distribution of dry spores. <u>Complementary method:</u> take spores from a cotyledon covered with conidia and deposit them on a leaf or blow the spores from a cotyledon.
10.5	First observation	8-10 days post inoculation
10.6	Second observation	-
10.7	Final observations	11-12 days post inoculation
11.	Observations	-
11.1	Method	visual
11.2	Observation scale	
	[1] susceptible	medium or intense sporulation all over the leaf disc surface
	[2] intermediate	weak sporulation all over the surface or isolated colonies on more than 10% of the surface
	[3] resistant	isolated colonies on less than 10% of the surface or no sporulation
11.3	Validation of test	on controls
11.4	Off-types	-

12.	Interpretation of data in terms of UPOV characteristic states	QN
13.	Critical control points	-

Ad. 72: Resistance to colonization by *Aphis gossypii*

1.	Pathogen	<i>Aphis gossypii</i>
2.	Quarantine status	no
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	INRA GAFL (FR)
5.	Isolate	NM1 clone
6.	Establishment isolate identity	-
7.	Establishment pathogenicity	on susceptible plants
8.	Multiplication inoculum	
8.1	Multiplication medium	living plant (obligate parasite), e.g. young plants of Melon or Cucumber
8.2	Multiplication variety	on susceptible variety (Corona, Védrantais, Ventura)
8.3	Plant stage at inoculation	at first leaf (measuring around 2-3 cm)
8.4	Inoculation medium	-
8.5	Inoculation method	deposit a piece of infested leaf (visual appreciation) or ten adult wingless aphids per plant
8.6	Harvest of inoculum	-
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-
9.	Format of the test	
9.1	Number of plants per genotype	30
9.2	Number of replicates	e.g. 3
9.3	Control varieties	
	[1] absent	Védrantais
	[9] present	AR Hale's Best Jumbo, AR Top Mark, Virgos
9.4	Test design	-
9.5	Test facility	-
9.6	Temperature	21-24°C day/16-20°C night
9.7	Light	16 hours per day
9.8	Season	-
9.9	Special measures	-
10.	Inoculation	
10.1	Preparation inoculum	-
10.2	Quantification inoculum	at least 10 adults wingless aphid per plant
10.3	Plant stage at inoculation	1st leaf measuring around 2-3 cm
10.4	Inoculation method	deposit of a piece of infested leaf or ten adult wingless aphids per plant

10.5	First observation	1-4 days post inoculation
10.6	Second observation	-
10.7	Final observations	5-10 days post inoculation
11.	Observations	
11.1	Method	visual, to compare with standards
11.2	Observation scale	
	[1] absent	9 or 10 adult aphids per plant; larvae frequent, plants covered with aphids, shriveled leaves
	[9] present	less than 7 adult aphids per plant; larvae rare. Remark: counting is not compulsory, it can be a visual assessment of the respective level of colonization.
11.3	Validation of test	on standards
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL
13.	Critical control points	Low aphid density to avoid having too many winged types. "Synchronous"-type breeding in order to have only aphids of the same age and, therefore, at the same growing stage on a plant. Normally <i>Aphis gossypii</i> is viviparous, but sometimes (autumn, on particular crops) may produce eggs.

Ad. 73: Resistance to *Zucchini yellow mosaic virus (ZYMV)*

1.	Pathogen	<i>Zucchini yellow mosaic virus (ZYMV)</i>
2.	Quarantine status	no
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	GEVES (FR)
5.	Isolate	F strain (e.g. strain 1318 Fn) or a NF strain (e.g. strain E15)
6.	Establishment isolate identity	use standard varieties, flaccida necrosis on Génériss (Zym ⁺ / Fn)
7.	Establishment pathogenicity	on susceptible melon varieties - as above
8.	Multiplication inoculum	
8.1	Multiplication medium	-
8.2	Multiplication variety	susceptible variety (e.g.: Védrantais)
8.3	Plant stage at inoculation	first leaf appearing
8.4	Inoculation medium	fresh and dried leaves homogenized, in PBS with carborundum
8.5	Inoculation method	rubbing
8.6	Harvest of inoculum	on symptomatic leaves
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-

9.	Format of the test	
9.1	Number of plants per genotype	at least 30
9.2	Number of replicates	e.g. 3
9.3	Control varieties	Védrantais, Jador, Cardillo (susceptible) Hannah's Choice, Lunaduke, PI 414723 (resistant)
9.4	Test design	-
9.5	Test facility	growth chamber
9.6	Temperature	22°C - 25°C during day and 18°C during night
9.7	Light	12 hours
9.8	Season	all seasons
9.9	Special measures	-
10.	Inoculation	
10.1	Preparation inoculum	ice cold buffer solution: Fresh leaves homogenized in PBS and carborundum
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	cotyledon expanded or first emergent leaf
10.4	Inoculation method	mechanical inoculation by rubbing of cotyledons with inoculum
10.5	First observation	-
10.6	Second observation	-
10.7	Final observations	14-15 days post inoculation
11.	Observations	
11.1	Method	visual, comparative
11.2	Observation scale	

Resistance to ZYMV		ZYMV - Strain F e.g. strain 1318 Fn	ZYMV - Strain NF e.g.: strain E15	
1	absent	Mosaic, non wilting	Mosaic, non wilting	
		Necrosis + slow wilting (flaccida necrosis)		
		Necrosis + fast wilting (flaccida necrosis)		
9	present	chlorotic or necrotic systemic lesions and possibly an apical necrosis		
9	present	No symptom		

11.3	Validation of test	on Standards
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL

13.	Critical control points	<p>The three distinct phenotypes associated with <u>susceptibility to ZYMV</u> strain F are connected with Fn gene.</p> <p>The Zym gene is epistatic on the Fn gene.</p> <p>The Fn gene modifies the susceptibility symptom expression of strain F: Fn/Fn is associated with fast wilting and necrosis (Flaccida-necrosis), Fn/Fn+ with the same reaction, but slower. Flaccida-necrosis is a form of systemic hypersensitivity, which is interpreted as susceptibility.</p> <p>The Fn gene has no influence on the symptom expression of resistant varieties.</p>
-----	-------------------------	--

Ad. 74: Resistance to *Papaya ringspot virus* (PRSV), Guadeloupe strain and E2 strain

1.	Pathogen	<i>Papaya ringspot virus</i> (PRSV)	
2.	Quarantine status	no	
3.	Host species	<i>Cucumis melo</i>	
4.	Source of inoculum	INRA Pathology - Avignon (FR)	
5.	Isolate	Guadeloupe strain and E2 strain	
6.	Establishment isolate identity		

Gene Pvr	Standards	Symptoms	Behavior against PRSV Guadeloupe strain
allele (Prv ⁺)	Védrantais	Mosaic (vein-clearing)	susceptible
allele (Prv ²)	72-025, PI 414723 Hannah's Choice	No systemic symptoms or Irregular local necrotic lesions on cotyledons	resistant
allele (Prv ¹)	WMR29	No systemic symptoms Occasional local necrotic lesions on cotyledons	resistant

Gene Pvr	Standards	Symptoms	Behavior against PRSV E2 strain
allele (Prv ⁺)	Védrantais	Mosaic (vein-clearing)	susceptible
allele (Prv ²)	72-025, PI 414723 Hannah's Choice	Apical necrosis Necrosis of plant instead of local lesions	susceptible
allele (Prv ¹)	WMR29	No systemic symptoms or few systemic chloronecrotic symptoms Occasional local necrotic lesions on cotyledons	resistant

7.	Establishment pathogenicity	-
----	-----------------------------	---

8.	Multiplication inoculum	
8.1	Multiplication medium	-
8.2	Multiplication variety	pre-multiplication of the virus on non-wilting variety (Védrantais) prior to testing
8.3	Plant stage at inoculation	First leaf appearing
8.4	Inoculation medium	PBS with carborundum
8.5	Inoculation method	rubbing
8.6	Harvest of inoculum	Fresh or dried leaves homogenized in PBS and carborundum
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	-
9.	Format of the test	
9.1	Number of plants per genotype	at least 30
9.2	Number of replicates	e.g. 3
9.3	Control varieties	Védrantais (susceptible) Hannah's Choice (resistant to Guadeloupe strain (Prv ² / Prv ⁺)) WMR 29 (resistant to E2 strain (Prv ¹ / Prv ⁺))
9.4	Test design	-
9.5	Test facility	-
9.6	Temperature	25°C /18°C
9.7	Light	12 h
9.8	Season	-
9.9	Special measures	-
10.	Inoculation	
10.1	Preparation inoculum	fresh leaves homogenized in PBS and carborundum
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	first emergent leaf
10.4	Inoculation method	mechanical inoculation by rubbing cotyledons with inoculums
10.5	First observation	15 days post inoculation
10.6	Second observation	-
10.7	Final observations	20 days post inoculation
11.	Observations	visual, comparative
11.1	Method	
11.2	Observation scale	

Resistance to PRSV - Guadeloupe strain	Gene Pvr	Symptoms
[1] absent	allele (Prv ⁺)	Mosaic (vein-clearing)
[9] present	allele (Prv ²)	No systemic symptoms Irregular local necrotic lesions on cotyledons
[9] present	allele (Prv ¹)	No systemic symptoms Occasional local necrotic lesions on cotyledons

Resistance to PRSV – E2 strain	Gene Pvr	Symptoms
[1] absent	allele (Prv ⁺)	Mosaic (vein-clearing)
[1] absent	allele (Prv ²)	Apical necrosis Necrosis of plant instead of local lesions
[9] present	allele (Prv ¹)	No systemic symptoms or few systemic chloronecrotic symptoms Occasional local necrotic lesions on cotyledons

11.3	Validation of test	on standards
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL
13.	Critical control points	-

Ad. 75: Resistance to *Melon necrotic spot virus* (MNSV), E8 strain

1.	Pathogen	<i>Melon necrotic spot virus</i> (MNSV)
2.	Quarantine status	-
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	GEVES (FR)
5.	Isolate	E8 strain
6.	Establishment isolate identity	Védrantais (susceptible) PMR5, VA 435, Virgos (resistant)
7.	Establishment pathogenicity	on susceptible plant
8.	Multiplication inoculum	
8.1	Multiplication medium	living plant
8.2	Multiplication variety	pre-multiplication of the virus on non-wilting variety (Védrantais) prior to testing
8.3	Plant stage at inoculation	10.3
8.4	Inoculation medium	-
8.5	Inoculation method	10.4
8.6	Harvest of inoculum	10.1
8.7	Check of harvested inoculum	symptomatic leaves
8.8	Shelflife/viability inoculum	on susceptible variety

9.	Format of the test	
9.1	Number of plants per genotype	at least 30
9.2	Number of replicates	e.g. 3
9.3	Control varieties	Védrantais (susceptible) Cyro, Primal, Virgos, Yellow Fun, (resistant)
9.4	Test design	-
9.5	Test facility	growth chamber
9.6	Temperature	25°C during day and 18°C during night or 22°C constant
9.7	Light	12 h per day
9.8	Season	all seasons
9.9	Special measures	-
10.	Inoculation	
10.1	Preparation inoculum	fresh leaves homogenized in PBS and carborundum
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	cotyledon expanded or 1 st emergent leaf
10.4	Inoculation method	mechanical inoculation by rubbing of cotyledons with inoculum
10.5	First observation	-
10.6	Second observation	-
10.7	Final observations	8-15 days after inoculation
11.	Observations	
11.1	Method	visual
11.2	Observation scale	
	[1] absent	necrotic lesions on the inoculated organs, possible systemic reaction (depends on condition, and varieties), possible death of plant
	[9] present	no lesions
11.3	Validation of test	on standards
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL
13.	Critical control points	-

Ad. 76: Resistance to *Cucumber mosaic virus (CMV)*

1.	Pathogen	<i>Cucumber mosaic virus (CMV)</i>
2.	Quarantine status	no
3.	Host species	<i>Cucumis melo</i>
4.	Source of inoculum	GEVES (FR)
5.	Isolate	Use "common" strains (e.g. Tl, P9)

6.	Establishment isolate identity	Védrantais, 72-025 (susceptible) PI 161375, Virgos (resistant)
7.	Establishment pathogenicity	on susceptible melon varieties
8.	Multiplication inoculum	don't use leaves dried with CaCl ₂ to inoculate, do a multiplication of the inoculum on susceptible plants
8.1	Multiplication medium	living plant
8.2	Multiplication variety	susceptible variety (e.g. Védrantais)
8.3	Plant stage at inoculation	cotyledon expanded or first leaf appearing
8.4	Inoculation medium	ice-cold buffer solution
8.5	Inoculation method	Inoculation by rubbing. Optional: after a few minutes, rinse the cotyledons with running water.
8.6	Harvest of inoculum	symptomatic leaves, e.g.: 1 g leaves with 4 mL buffer - 0,03 M PBS with 0.2% DIECA freshly added, addition of activated charcoal.
8.7	Check of harvested inoculum	-
8.8	Shelflife/viability inoculum	about 2 h
9.	Format of the test	
9.1	Number of plants per genotype	at least 30 plants
9.2	Number of replicates	e.g. 3
9.3	Control varieties	Védrantais (susceptible) Lunaduke, Virgos (resistant)
9.4	Test design	-
9.5	Test facility	climatic room or glasshouse
9.6	Temperature	22°C constant
9.7	Light	12 hours at least
9.8	Season	all seasons in climatic room, in glasshouse, strong environmental effect on the test severity (more severe in winter, too soft in summertime)
9.9	Special measures	-
10.	Inoculation	
10.1	Preparation inoculum	Fresh leaves homogenized in ice-cold buffer solution- in PBS and carborundum (active charcoal), with 0.2% DIECA freshly added.
10.2	Quantification inoculum	-
10.3	Plant stage at inoculation	cotyledon expanded or first leaf appearing
10.4	Inoculation method	Inoculation by rubbing. After a few minutes, rinse the cotyledons with running water, when uses activated charcoal.
10.5	First observation	-
10.6	Second observation	-
10.7	Final observations	7-8 days after inoculation

11.	Observations	
11.1	Method	visual, comparative
11.2	Observation scale	
	[1] absent	Mosaics
	[9] present	No symptoms or necrotic spot or very weak symptoms in case of a more aggressive strain like T1. <i>Remarks:</i> P9 strain brings out "aucuba" mosaic on susceptible varieties (aggressive symptoms) P9 strain is less virulent than T1 strain.
11.3	Validation of test	on control varieties
11.4	Off-types	-
12.	Interpretation of data in terms of UPOV characteristic states	QL
13.	Critical control points	<ul style="list-style-type: none"> - When light intensity and daylight are not sufficient (winter period), resistant plants (in particular PI 161375) may present chlorotic lesions on the first leaf. - Virgos seeds usually germinate better than seeds of PI 161375 - Songwhan Charmi = PI 161375: name of the melon variety, on which this strain was identified. The "song" strains break the common resistance to CMV (e.g.: "song" strains 14, T2). - Intermediate reactions may occur; the resistance is polygenic.

10. Technical Questionnaire

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
		Application date: (not to be filled in by the applicant)
<p style="text-align:center">TECHNICAL QUESTIONNAIRE to be completed in connection with an application for plant breeders' rights</p>		
1. Subject of the Technical Questionnaire		
1.1 Botanical name	<i>Cucumis melo L.</i>	
1.2 Common Name	Melon	
2. Applicant		
Name		
Address		
Telephone No.		
Fax No.		
E-mail address		
Breeder (if different from applicant)		
3. Proposed denomination and breeder's reference		
Proposed denomination (if available)		
Breeder's reference		

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

4. Information on the breeding scheme and propagation of the variety

4.1 Breeding scheme

Variety resulting from:

4.1.1 Crossing

- (a) controlled cross []
(please state parent varieties)
- (b) partially known cross []
(please state known parent variety(ies))
- (c) totally unknown cross []

4.1.2 Discovery and development []
(please state where and when discovered
and how developed)

4.1.3 Other []
(please provide details)

4.2 Method of propagating the variety

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
5. Characteristics of the variety to be indicated (the number in brackets refers to the corresponding characteristic in Test Guidelines; please mark the note which best corresponds).		
Characteristics	Example Varieties	Note
5.1 Inflorescence: sex expression (at full flowering) (12)		
monoecious	Alpha, Categoría	1[]
andromonoecious	Piel de Sapo	2[]
5.2 Fruit: shape in longitudinal section (28)		
ovate	De Cavaillon, Piolín	1[]
medium elliptic	Piel de Sapo	2[]
broad elliptic	Corin, Sardo	3[]
circular	Alpha, Galia	4[]
quadrangular	Zatta	5[]
oblate	Jívaro, Noir de Carmes	6[]
obovate	Cganchi	7[]
elongated	Alficoz, Banana	8[]
5.3 Fruit: ground color of skin (29)		
white	Albino, Honey Dew	1[]
yellow	Amarillo-Canario, Edén, Galia, Passport, Solarking	2[]
green	Gohyang, Piel de Sapo	3[]
grey	Geaprince, Geamar, Romeo, Sirio, Supporter, Védrantais	4[]

TECHNICAL QUESTIONNAIRE		Page {x} of {y}	Reference Number:
Characteristics		Example Varieties	Note
5.4	Fruit: density of patches		
(36)			
	absent or very sparse	Rochet	1[]
	sparse		3[]
	medium	Braco	5[]
	dense	Piel de Sapo	7[]
	very dense	Oranje Ananas	9[]
5.5	Fruit: warts		
(38)			
	absent	Piel de Sapo	1[]
	present	Zatta	9[]
5.6	Fruit: grooves		
(43)			
	absent or very weakly expressed	Piel de Sapo, Arava	1[]
	weakly expressed	Total, Hobby	2[]
	strongly expressed	Védrantais, Galia	3[]
5.7	Fruit: cork formation		
(48)			
	absent	Alpha	1[]
	present	Dalton	9[]
5.8	Fruit: pattern of cork formation		
(50)			
	dots only	Hermes, Védrantais	1[]
	dots and linear	Jivaro, Topper	2[]
	linear only	Futuro, Riosol	3[]
	linear and netted	Anatol, Chantal	4[]
	netted only	Galia, Perlita	5[]

TECHNICAL QUESTIONNAIRE		Page {x} of {y}	Reference Number:
Characteristics		Example Varieties	Note
5.9	Fruit: density of pattern of cork formation (51)		
	very sparse	Alpha, Amarillo Oro	1[]
	sparse	Védrantais	3[]
	medium	Regal, Vital	5[]
	dense	Galia, Geamar	7[]
	very dense	Honey Rock, Perlita	9[]
5.10	Fruit: main color of flesh (54)		
	white	Piel de Sapo	1[]
	greenish white	Galia	2[]
	green	Radical	3[]
	yellowish white	Guaraní	4[]
	orange	Védrantais	5[]
	reddish orange	Magenta	6[]
5.11	Seed: length (60)		
	very short	Geumssaraki, Golden Crispi	1[]
	short	Elario, Katsura Giant	3[]
	medium	Arava, Sancho	5[]
	long	Amarillo Oro, Toledo	7[]
	very long	Albino	9[]
5.12	Seed: color (63)		
	whitish	Amarillo Oro s.b.	1[]
	cream yellow	Galia, Piel de Sapo	2[]

TECHNICAL QUESTIONNAIRE		Page {x} of {y}	Reference Number:

6. Similar varieties and differences from these varieties

Please use the following table and box for comments to provide information on how your candidate variety differs from the variety (or varieties) which, to the best of your knowledge, is (or are) most similar. This information may help the examination authority to conduct its examination of distinctness in a more efficient way.

Denomination(s) of variety(ies) similar to your candidate variety	Characteristic(s) in which your candidate variety differs from the similar variety(ies)	Describe the expression of the characteristic(s) for the similar variety(ies)	Describe the expression of the characteristic(s) for your candidate variety
<i>Example</i>	<i>Density of pattern of cork formation</i>	<i>dense</i>	<i>medium</i>

7.3 Other information

7.3.1 Resistance to pests and diseases (please specify races/strains if possible)

	susceptible	moderately resistant	highly resistant	not tested
(a) <i>Fusarium oxysporum</i> f. sp. <i>melonis</i> , Race 1.2 (char. 69.4)	[]	[]	[]	[]
(b) <i>Podosphaera xanthii</i> (ex <i>Sphaerotheca fuliginea</i>), Race 1 (char. 70.1)	[]	[]	[]	[]
(c) <i>Podosphaera xanthii</i> (ex <i>Sphaerotheca fuliginea</i>), Race 2 (char. 70.2)	[]	[]	[]	[]
(d) <i>Podosphaera xanthii</i> (ex <i>Sphaerotheca fuliginea</i>), Race 3 (char. 70.3)	[]	[]	[]	[]
(e) <i>Podosphaera xanthii</i> (ex <i>Sphaerotheca fuliginea</i>), Race 5 (char. 70.4)	[]	[]	[]	[]
(f) <i>Podosphaera xanthii</i> (ex <i>Sphaerotheca fuliginea</i>), Race 3-5 (char. 70.5)	[]	[]	[]	[]
(g) <i>Golovinomyces cichoracearum</i> (ex <i>Erysiphe cichoracearum</i>), Race 1 - Powdery mildew - Gc (Ec) (char. 71)	[]	[]	[]	[]

	absent	present	not tested
(h) colonization by <i>Aphis gossypii</i> (char. 72)	[]	[]	[]
(i) <i>Zucchini yellow mosaic virus</i> (ZYMV) (char. 73)	[]	[]	[]
(j) <i>Papaya ringspot virus</i> (PRSV) (char. 74)	[]	[]	[]

Strain to precise:

- Guadeloupe
- E2

(k) <i>Melon necrotic spot virus</i> (MNSV), E8 strain (char. 75)	[]	[]	[]
(l) <i>Cucumber mosaic virus</i> (CMV) (char. 76)	[]	[]	[]

7.3.2 A representative color photograph of the variety should accompany the Technical Questionnaire.

TECHNICAL QUESTIONNAIRE	Page {x} of {y}	Reference Number:
-------------------------	-----------------	-------------------

8. Authorization for release

(a) Does the variety require prior authorization for release under legislation concerning the protection of the environment, human and animal health?

Yes [] No []

(b) Has such authorization been obtained?

Yes [] No []

If the answer to (b) is yes, please attach a copy of the authorization.

9. Information on plant material to be examined or submitted for examination

9.1 The expression of a characteristic or several characteristics of a variety may be affected by factors, such as pests and disease, chemical treatment (e.g. growth retardants or pesticides), effects of tissue culture, different rootstocks, scions taken from different growth phases of a tree, etc.

9.2 The plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If the plant material has undergone such treatment, full details of the treatment must be given. In this respect, please indicate below, to the best of your knowledge, if the plant material to be examined has been subjected to:

- | | | |
|--|---------|--------|
| (a) Microorganisms (e.g. virus, bacteria, phytoplasma) | Yes [] | No [] |
| b) Chemical treatment (e.g. growth retardant, pesticide) | Yes [] | No [] |
| (c) Tissue culture | Yes [] | No [] |
| (d) Other factors | Yes [] | No [] |

Please provide details for where you have indicated "yes".
