I. Subject of these Guidelines

These Test Guidelines apply to all varieties of *Eustoma grandiflorum* (Raf.) Shinn. of the family Gentianaceae.

II. Material Required

1. The competent authorities decide when, where and in what quantity and quality the plant material/seed required for testing the variety is to be delivered. Applicants submitting material from a State other than that in which the testing takes place must ensure that all customs formalities are complied with. As a minimum, the following quantity of plant material is recommended:

seed propagated varieties: 1000 seeds
vegetatively propagated varieties: 40 plantlets .

2. In the case of seed, the seed should meet the minimum requirements for germination, species and analytical purity, health and moisture content, specified by the competent authority. In cases where the seed is to be stored, the germination capacity should be as high as possible and should be stated by the applicant.

3. The plant material must not have undergone any treatment unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

III. Conduct of Tests

1. A test should normally be conducted in a single growing cycle. If distinctness and/or uniformity cannot be sufficiently examined in a single growing cycle, the test should be extended for a second growing cycle.

2. The tests should normally be conducted at one place. If any important characteristics of the variety cannot be seen at that place, the variety may be tested at an additional place.

3. The tests should be carried out under greenhouse conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

Seed propagated varieties:

Seed sowing: Time: January to February (in Northern Hemisphere) .
Temperature: 15°C minimum .
Sowing medium: well-drained, moisture holding, fertile, pH 6.0 to 6.5 .
Use cell tray (2.5x2.5x4.5cm) .
No soil covering .
Bench irrigation .

Transplanting of seedlings : Plant stage: 4 true leaves .
Time: Mid March to May (in Northern Hemisphere) .

Soil: well-drained and moisture holding , fertile, rich in
organic material, pH 6.0 to 6.5 .

Planting density: 15 × 15 cm .

Temperature: Day: +20 to 25 °C.
Night: +13 to 15 °C.

Vegetatively propagated varieties:

Planting: Mid March (in Northern Hemisphere) , temperature 18 °C.

Planting density: 20 × 20 cm.

Plants pinched after 3 pairs of leaves.

4. The size of the plots should be such that plants or parts of plants may be removed for measurement and counting without prejudice to the observations which must be made up to the end of the growing period. For vegetatively propagated varieties, each test should be designed to result in a total of, at least 40 plants, which should be divided between two or more replicates. For seed propagated varieties, each test should be designed to result in a total of, at least 60 plants, which should be divided between two or more replicates. Separate plots for observation and measuring can only be used if they have been subject to similar environmental conditions.

5. Additional tests for special purposes may be established.

IV. Methods and Observations

1. All observations should be made on 40 plants or part taken from each of 40 plants.

2. For the assessment of uniformity of vegetatively propagated varieties a population standard of 2% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 40 plants, the maximum number of off-types allowed would be 2. For the assessment of uniformity of seed propagated varieties, the recommendations in the General Introduction for cross-pollinated or hybrid varieties should be followed, as appropriate.

3. All observations should be made on flowering plants.

4. The length of the internode and green color of the stem should be observed on the fourth internode from the top.

5. All observations on the leaf should be made on the third leaf from the top. For determining the color of the leaf and the stem the bloom should be removed.

6. All observations on the flower and the pedicel should be made on the second flower to open. Color observation on the petals should be made on its inner side.

7. Because daylight varies, color determinations made against a color chart should be made either in a suitable cabinet providing artificial daylight or in the middle of the day in a room without direct sunlight. The spectral distribution of the illuminant for artificial daylight should conform with the CIE Standard of Preferred Daylight D 6500 and should fall within the tolerances set out in the British Standard 950, Part I. These determinations should be made with the plant part placed against a white background.

V. Grouping of Varieties

1. The collection of varieties to be grown should be divided into groups to facilitate the assessment of distinctness. Characteristics which are suitable for grouping purposes are those which are known from experience not to vary, or to vary only slightly, within a variety. Their various states of expression should be fairly evenly distributed throughout the collection.

2. It is recommended that the competent authorities use the following characteristics for grouping varieties:

(a) Flower: type (characteristic 15)

(b) Petal: number of colors (characteristic 24)

(c) One-colored varieties only: Petal: color of upper side (characteristic 25) with the following groups:

Gr. 1: white

Gr. 2: yellow

Gr. 3: light green

Gr. 4: pink

Gr. 5: orange

Gr. 6: red

Gr. 7: purple

Gr. 8: violet

(d) Bi-colored varieties only: Petal: main color of upper side (characteristic 26) with the following groups:

Gr. 1: white

Gr. 2: yellow

Gr. 3: light green

Gr. 4: pink

Gr. 5: orange

Gr. 6: red

Gr. 7: purple

Gr. 8: violet

- (e) Bi-colored varieties only : Petal: secondary color of upper side (characteristic 27)
with the following groups:
Gr.1:white
Gr.2:yellow
Gr.3:lightgreen
Gr.4:pink
Gr.5:orange
Gr. 6:red
Gr.7:purple
Gr. 8:violet
- (f) Petal: color of base (characteristic 31)
- (g) Time of beginning of flowering (characteristic 36)

VI. Characteristics and Symbols

1. To assess distinctness, uniformity and stability, the characteristics and their states as given in the Table of Characteristics should be used.
 2. Notes (numbers), for the purposes of electronic data processing, are given opposite the states of expression for each characteristic.
 3. Legend
- (*) Characteristics that should be used on all varieties in every growing period over which examinations are made and always be included in the variety descriptions, except when the state of expression of a preceding characteristic or regional environmental conditions render this impossible.
- (+) See Explanations on the Table of Characteristics in Chapter VIII.
